# Outline

- Introduction
- The  $\text{AdS}_3/\text{CFT}_2$  correspondence
- The Ryu-Takayanagi formula
- Segmented strings in  $\text{AdS}_3$
- Ryu-Takayanagi formula for segmented strings
- Correspondence in even dimensions
- Continuous limit
- Summary and outlook

# Introduction

- Electromagnetism
- Weak interaction
- Strong interaction
- Gravity

## Quantum gauge theories

(QED, EWT, QCD)

**Quantum gravity???**

Possible solution – String theory

**AdS/CFT correspondence**

**String theory on curved background**

**Field theory in Minkowski space**

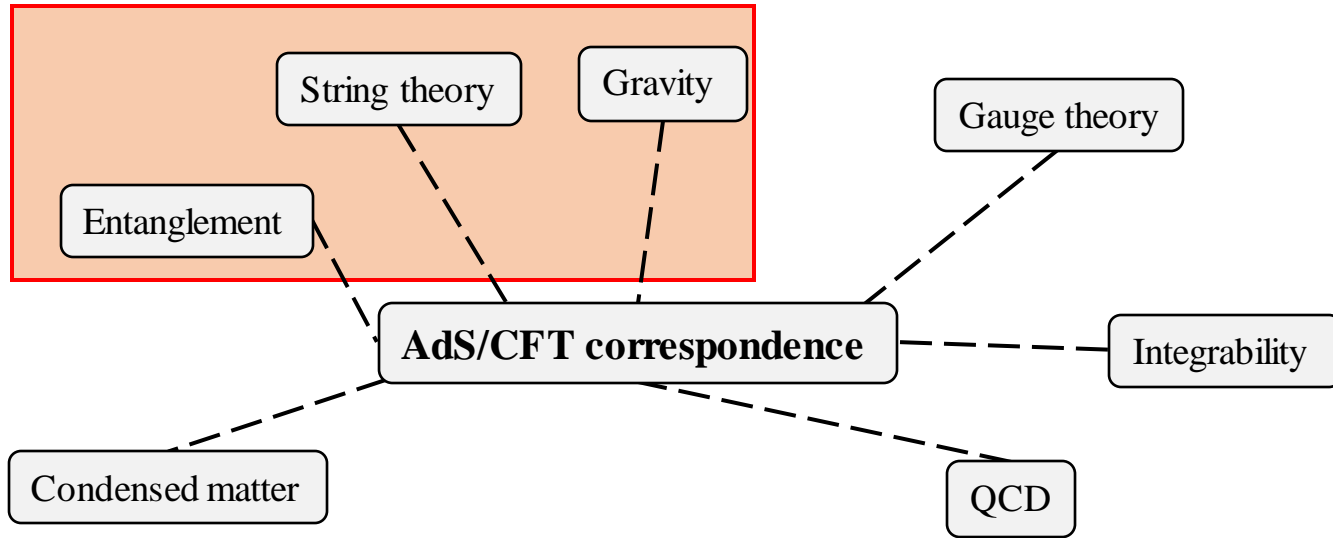

Original form: [Maldacena'97]

- IIB superstring theory on  $AdS_5 \times S^5$
- $\mathcal{N} = 4$  supersymmetric Yang-Mills theory

Other aspect: [Ryu, Takayanagi'06] [Raamsdonk'10]

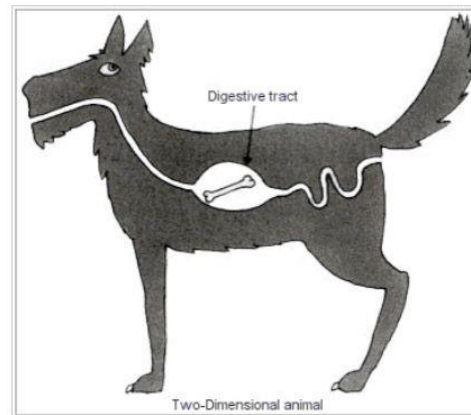

- Spacetime is built up of quantum entanglement

# Introduction

## In our case:

- Strings in  $AdS_3$
- Entanglement in  $CFT_2$

# AdS<sub>3</sub> space

## Einstein equations:

- In vacuum:  $G_{\mu\nu} + \Lambda g_{\mu\nu} = 0$

- Cosmological constant:  $\Lambda$ 
  - $\Lambda > 0$ : de Sitter space
  - $\Lambda = 0$ : Minkowski space
  - $\Lambda < 0$ : **Anti-de Sitter (AdS) space**

## AdS<sub>3</sub> space:

- Embedding space:  $\mathbb{R}^{2,2}$
- 2+1 dimensional subset:  $AdS_3$  space
- Metric:

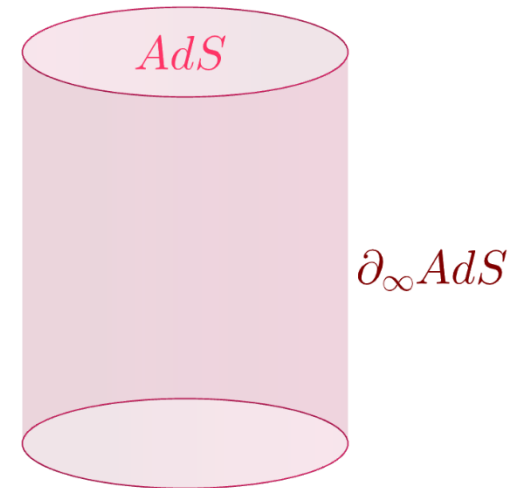

$$ds^2 = -(dX^{-1})^2 - (dX^0)^2 + (dX^1)^2 + (dX^2)^2$$

- Constraint:

$$X \cdot X = -(X^{-1})^2 - (X^0)^2 + (X^1)^2 + (X^2)^2 = -L^2$$

## Boundary of AdS<sub>3</sub> space:

- $\partial_\infty AdS_3 = \mathbb{P}\{U \in \mathbb{R}^{2,2} | U \cdot U = 0\}$

# AdS<sub>3</sub> space

## Poincaré upper half-space model:

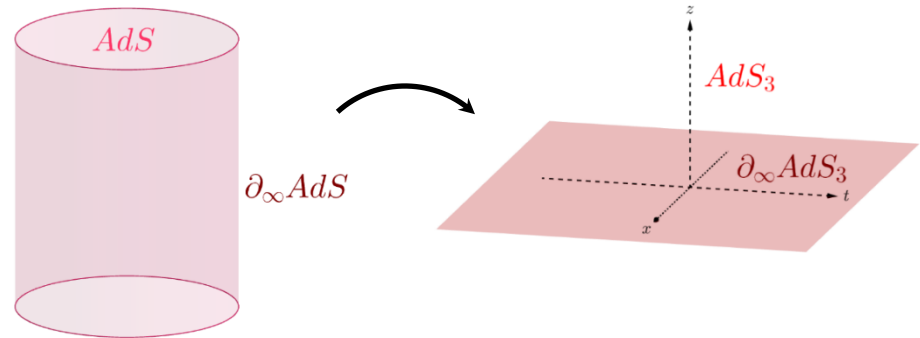

- 2 + 1 dimensional representation of the AdS<sub>3</sub> space
- Coordinates:  $(z, x^0, x^1)$

$$(X^{-1}, X^\mu, X^d) = \left( \frac{-z^2 - x^2 - L^2}{2z}, \frac{Lx^\mu}{z}, \frac{-z^2 - x^2 + L^2}{2z} \right)$$

- Metric:  $ds^2 = L^2 \frac{dz^2 - (dx^0)^2 + (dx^1)^2}{z^2}$

## Boundary:

- $z \rightarrow 0 \Rightarrow$  Coordinates:  $(x^0, x^1)$
- Metric:  $ds^2 \propto -(dx^0)^2 + (dx^1)^2$
- Conformally equivalent to the 1+1 dimensional Minkowski space

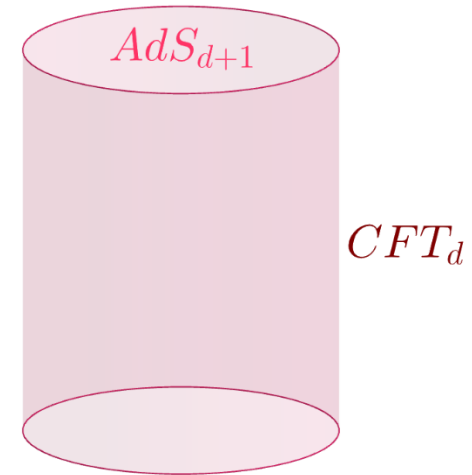

# The AdS/CFT correspondence

## Conformal field theory:

- Quantum field theory
- With conformal invariance
- In  $d = 2$ : infinite-dimensional symmetry algebra
- Exactly solvable!

## AdS<sub>3</sub>/CFT<sub>2</sub> correspondence:

- $\partial_\infty AdS_3 \sim 1+1$  dimensional Minkowski space
- Conformal field theory on the boundary

Classical quantities ( $AdS_3$ )  
 $\updownarrow$   
Field theoretical quantities ( $CFT_2$ )

$$Z_{grav} \left[ \Phi \Big|_{\partial AdS} = J \right] = Z_{CFT} [J]$$

# Entanglement in CFT<sub>2</sub>

## Von Neumann entropy:

- Statistical ensemble
- Density matrix  $\rho$
- Von Neumann entropy:  $S = -tr\{\rho \log \rho\}$
- Measures indeterminacy of the system

## Entanglement in CFT<sub>2</sub>:

- 1+1 dimensional CFT in vacuum state
- Observer that only has access to a region  $A$
- Measures different density matrix:  $\rho_A = tr_{\bar{A}}\rho$
- Entanglement entropy:  $S(A) = -tr\{\rho_A \log \rho_A\}$
- Measures the entanglement between  $A$  and  $\bar{A}$

## For an interval: [Calabrese, Cardy'18]

- Let  $A$  be an interval
- Length  $R$
- *Note:* Cutoff dependent ( $\delta$ )

$$S(A) = \frac{c}{3} \log \frac{R}{\delta}$$

$c$ : central charge of CFT

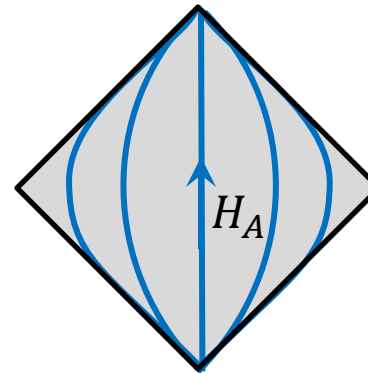

# Entanglement in $\text{CFT}_2$

## Causal diamonds:

- Causal diamond = causality domain of a subsystem  $A$
- Described by its past and future tips  $x^\mu$  and  $y^\mu$
- Reduced density matrix:  $\rho_A = e^{-H_A}$
- Where  $H_A$ : **modular Hamiltonian**

## Kinematic space: [Boer'16]

- Space of causal diamonds (or subsystems)  $\rightarrow$  Coordinates:  $(x^\mu, y^\nu)$
- Coset structure:  $\frac{SO(2,2)}{SO(1,1) \times SO(1,1)} \rightarrow$  Invariant metric:  $\omega_{\mu\nu}$

# Spherical minimal surfaces of AdS<sub>3</sub>

## Minimal surfaces of AdS<sub>3</sub>:

- Two null vectors:  $U, V \in \mathbb{R}^{2,2}: U \cdot U = V \cdot V = 0$
- Minimal surface =  $\{X \mid U \cdot X = 0 \cap V \cdot X = 0\}$

$$x_u^\mu = L \frac{U^\mu}{U^d - U^{-1}}$$

$$x_v^\nu = L \frac{V^\nu}{V^d - V^{-1}}$$

## In the Poincaré model:

- $U \cdot X = 0$  and  $V \cdot X = 0 \rightarrow$  **Two cones**
- Tips of cones are on the boundary:  $x_u, x_v$
- Minimal surface: **One dimensional circular arc**
- Image on the boundary: **Interval**, causal diamond

## Area of minimal surfaces:

- Area:  $A(U, V) = L \log \frac{4R^2}{\delta^2}$
- Where:  $R^2 = -\frac{1}{4}(x_u - x_v) \cdot (x_u - x_v)$
- Cutoff:  $z > \delta$

**Proportional to the entanglement entropy of the resulting boundary interval**

# The Ryu-Takayanagi formula

The Ryu-Takayanagi formula: [Ryu, Takayanagi'06]

- $AdS_3$  space
- Vacuum  $CFT_2$  on the boundary
- Brown-Henneaux formula:  $c = \frac{3L}{2G}$  [Brown'86]
- An  $A$  spacelike  $CFT$  subsystem, border  $\partial A$ :
  - Entanglement entropy:  $S(A) = -Tr\{\rho_A \log \rho_A\}$
- $\varepsilon_A$   $AdS$  minimal surface, border  $\partial A$ :
  - Surface area:  $A_{min}(A)$

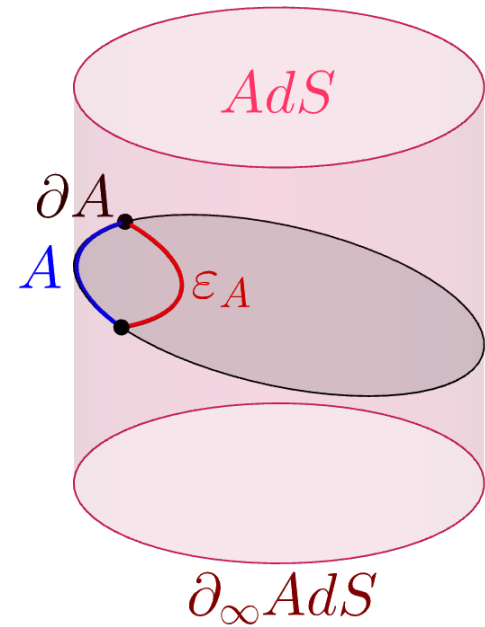

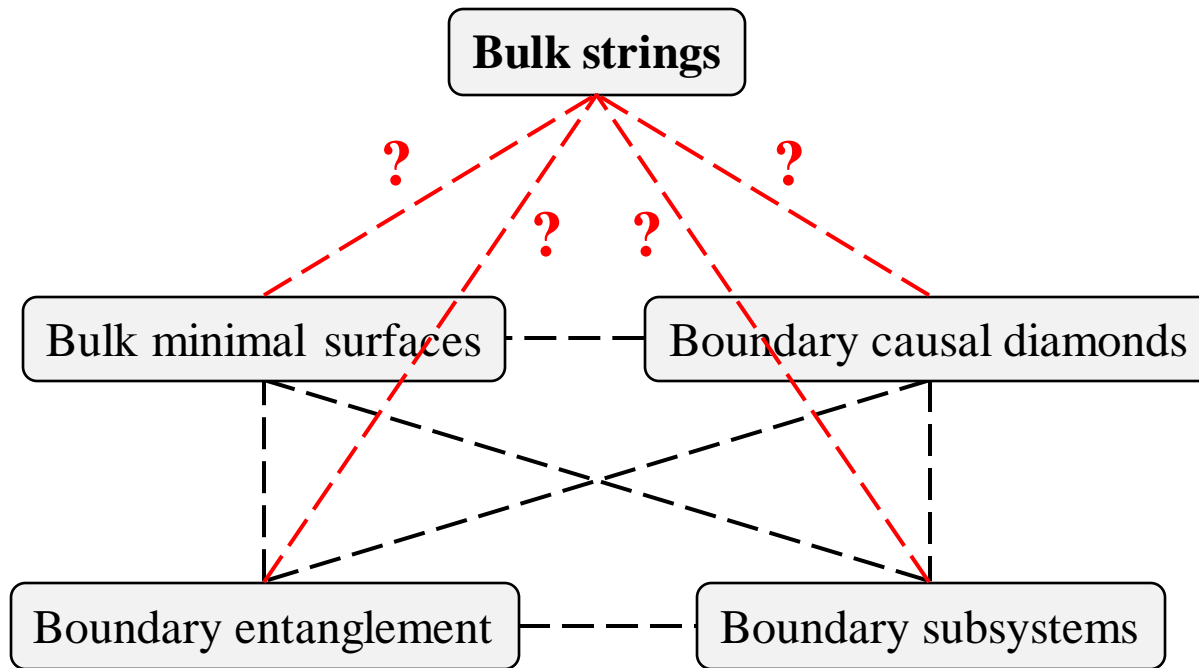

$$S(A) = \frac{A_{min}(A)}{4G}$$

Ryu-Takayanagi formula

In our case:

- Image of minimal surface on the boundary: Interval
- Entanglement entropy:  $S(U, V) = \frac{L}{4G} \log \frac{4R^2}{\delta^2}$

# Classical strings in AdS<sub>3</sub>

## One dimensional classical strings:

- **String:** One dimensional object
- Propagation in spacetime: Two dimensional „worldsheet”
- Two parameters:  $(\tau, \sigma)$  or  $(\sigma^+, \sigma^-)$
- Action:  $S = -\frac{T}{2} \int d\tau d\sigma \sqrt{-h} h^{ab} \partial_a X \cdot \partial_b X \sim$  Surface area
- $\delta S = 0$   $\left\{ \begin{array}{l} \text{Equation of motion} \\ \text{Virasoro constraints} \end{array} \right.$

## Strings in AdS<sub>3</sub>:

- Embedding space: AdS<sub>3</sub>
- Equations of motion:

$$\begin{aligned} \partial_+ \partial_- X - (\partial_- X \cdot \partial_+ X) X &= 0 \\ \partial_+ X \cdot \partial_+ X = \partial_- X \cdot \partial_- X &= 0 \\ X \cdot X &= -L^2 \end{aligned}$$

- Normal vector:  $N_a = \frac{\epsilon_{abcd} X^b \partial_- X^c \partial_+ X^d}{\partial_- X \cdot \partial_+ X}$

# Segmented strings in AdS space

## Segmented strings: [Callebaut'15]

- Simplest solution: constant normal vector
- **String segment**: quadrangle with constant normal vector
- Segmented string: solution built up by segments
- Vertices:  $V_i \cdot V_i = -L^2, i = 1,2,3,4$
- Edges:  $p_i = \pm(V_i - V_{i+1}), i = 1,2,3,4$

$$p_i \cdot p_i = 0$$

$$X(\sigma^-, \sigma^+) = \frac{L^2 + \sigma^+ \sigma^- \frac{1}{2} p_1 \cdot p_4}{L^2 - \sigma^+ \sigma^- \frac{1}{2} p_1 \cdot p_4} V_1 + L^2 \frac{\sigma^- p_1 + \sigma^+ p_4}{L^2 - \sigma^+ \sigma^- \frac{1}{2} p_1 \cdot p_4}$$

## Area of a string segment:

- Evaluating the string action with the segmented solution

$$A_{\square} = L^2 \log \frac{(p_1 \cdot p_4)(p_2 \cdot p_3)}{(p_1 \cdot p_2)(p_3 \cdot p_4)}$$

- *Note*: Cutoff independent!

# Segmented strings and the boundary

## Projection to the boundary:

- $p_i \cdot p_i = 0$  !
- $p_i$  define four cones in AdS via  $p_i \cdot X = 0$
- At each vertex two edges meet
- Therefore each vertex lies on an intersection of a pair of cones
- Let:  $x_i^\mu = L \frac{p_i^\mu}{p_i^d - p_i^-}$
- Then  $(x_i^\mu, x_j^\nu)$  defines a causal diamond and a subsystem  $(ij)$

## Area of the string segment:

$$A_{\square} = L^2 \log \frac{R_{14}^2 R_{23}^2}{R_{12}^2 R_{34}^2} = A_{14} + A_{23} - A_{34} - A_{12}$$

- Where:  $R_{ij}^2 = -\frac{1}{4}(x_i - x_j)^2$

# Ryu-Takayanagi formula for segmented strings

## Timelike segmented string:

- Edges:  $p_i: p_i \cdot p_i = 0, i = 1,2,3,4$
- For vertices:  $p_i \cdot X = 0$
- Area:  $A = L^2 \log \frac{R_{14}^2 R_{23}^2}{R_{12}^2 R_{34}^2}$

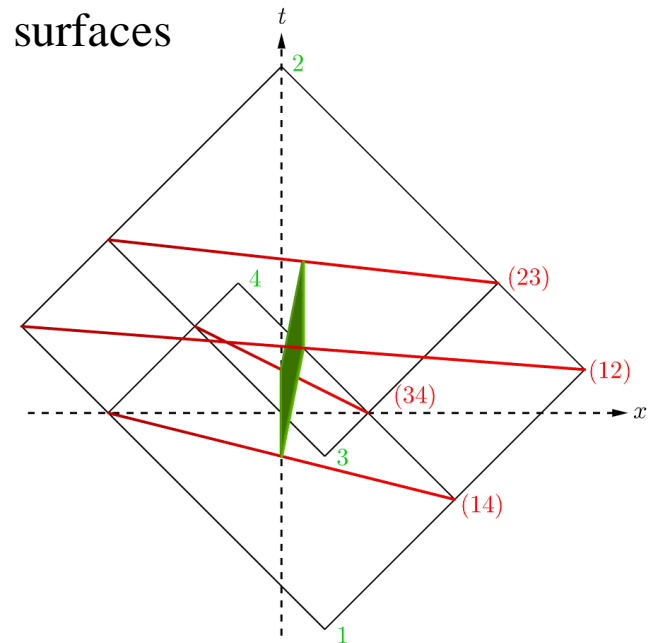

## Spacelike minimal surfaces:

- Cones:  $p_i \cdot X = 0$
- Their intersections: (14), (23), (12), (34) minimal surfaces
- Segment vertices lie on them!
- Their areas:  $A(ij) = L \log \frac{4R_{ij}^2}{\delta^2}$

## CFT vacuum subsystems:

- Images of minimal surfaces:  $(ij)$  subsystems
- Their entanglement entropies:  $S(ij) = \frac{A(ij)}{4G}$

$$A \equiv 4GL(S(14) + S(23) - S(34) - S(12))$$

# Interpretation and consequences

## Interpretation:

- CFT subsystems
- Flow of boundary causal diamonds

Holograms of bulk strings

## Interesting properties: Eg.:

- For a segment:  $p_1 + p_2 = p_3 + p_4$
- On the boundary: causal diamonds lie on a common hyperbola
- Accelerating frame

## Consequences: Eg.: strong subadditivity:

- Subsystems  $A, B, C$

$$S(AB) + S(BC) - S(B) - S(ABC) \geq 0$$

**Strong subadditivity!**

- Measuring on a larger subsystem reduces uncertainty
- $\exists A, B, C$  subsystems:  $A_{\square} \sim S(AB) + S(BC) - S(B) - S(ABC)$
- Geometrically: Positivity of segment area  $A \geq 0$

# Minimal surfaces in higher dimensions

## Minimal surfaces of the $AdS_{d+1}$ :

- Two null vectors:  $U, V \in \mathbb{R}^{2,d}; U \cdot U = V \cdot V = 0$
- Minimal surface =  $\{X \mid U \cdot X = 0 \cap V \cdot X = 0\}$

## In the Poincaré model:

- $U \cdot X = 0$  and  $V \cdot X = 0 \rightarrow$  **Two cones**
- Tips of the cones are on the boundary:  $x_u, x_v$
- Minimal surface: **d-1 dimensional sphere**
- Image on the boundary: **d-2 sphere**, causal diamond

## Area of minimal surfaces: [Ryu, Takayanagi'06]

- If  $d = \text{even}$ :  $A = \left( \text{Powers of } \frac{R}{\delta} \right) + \alpha \log \frac{R^2}{\delta^2}$

- If  $d = \text{odd}$   $A = \left( \text{Powers of } \frac{R}{\delta} \right)$

# Correspondence in even dimensions

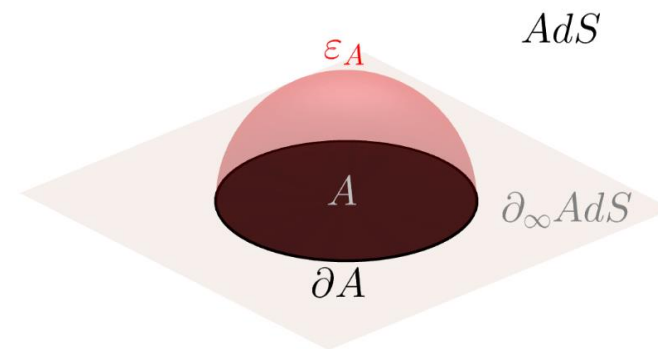

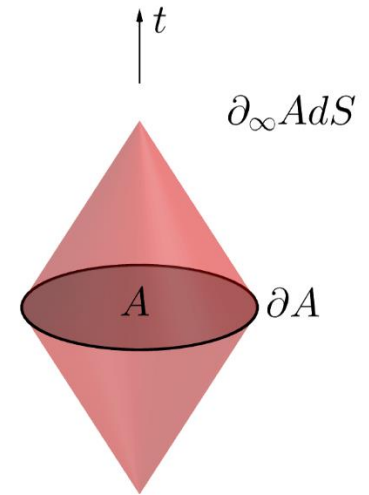

## Ryu-Takayanagi proposal in higher dimensions:

- $AdS_{d+1}$  space
- Boundary  $CFT_d$  in vacuum state
- $A$  spacelike  $CFT$  subsystem with boundary  $\partial A$
- $\varepsilon_A$   $AdS$  minimal surface with boundary  $\partial A$
- Entanglement entropy in general:

$$S(A) = \frac{A_{min}(A)}{4G}$$

## Entropy in higher dimensions:

- $S = S^\partial + S^{uni} + S^{other}$
- $S \propto \frac{A(\partial A)}{\delta^{d-2}}$
- If  $d = \text{even}$ :  $S^{uni} \propto \log \frac{R}{\delta}$
- If  $d = \text{odd}$ :  $S^{uni} = \text{const.}$

# Segmented strings in higher dimensions

## Strings in $\text{AdS}_{d+1}$ :

- Embedding space:  $\text{AdS}_{d+1}$
- Equations of motion:

$$\begin{aligned} \partial_+ \partial_- X - (\partial_- X \cdot \partial_+ X) X &= 0 \\ \partial_+ X \cdot \partial_+ X = \partial_- X \cdot \partial_- X &= 0 \\ X \cdot X &= -L^2 \end{aligned}$$

## Segmented strings:

- Vertices:  $V_i \cdot V_i = -L^2, i = 1, 2, 3, 4$
- Edges:  $p_i = \pm(V_i - V_{i+1}), i = 1, 2, 3, 4$
- Same interpolation ansatz

## Projection to the boundary:

- Let:  $x_i^\mu = L \frac{p_i^\mu}{p_i^d - p_i^-}$

## Area of the string segment:

$$A_{\square} = L^2 \log \frac{R_{14}^2 R_{23}^2}{R_{12}^2 R_{34}^2}$$

- Where:  $R_{ij}^2 = -\frac{1}{4}(x_i - x_j)^2$

## Correspondence in even dimensions:

- $d = \text{even}$
- Edges:  $p_i \leftrightarrow \text{Cones}$
- Vertices on minimal surfaces
- Minimal surfaces  $\leftrightarrow$  Spherical subsystems
- Area of segment  $\leftrightarrow$  Entanglement

$$A \sim (S^{uni}(14) + S^{uni}(23) - S^{uni}(34) - S^{uni}(12))$$

$d = \text{odd?}$

# Continuous limit

## Continuous limit:

- General  $\text{AdS}_{d+1}$  space
- Directional derivatives:  $\partial_- X, \partial_+ X$   
 $\rightarrow$  Virasoro constraints:  $\partial_+ X \cdot \partial_+ X = \partial_- X \cdot \partial_- X = 0$
- Poincaré coordinates:  $x^\mu = L \frac{\partial_- X^\mu}{\partial_- X^d - \partial_- X^{-1}}, y^\mu = \frac{\partial_+ X^\mu}{\partial_+ X^d - \partial_+ X^{-1}}$
- On the worldsheet:  $\partial_- X \cdot X = 0, \partial_+ X \cdot X = 0$   
 $\rightarrow$  Causal diamond with tips  $x^\mu, y^\mu$
- String action in causal diamond coordinates:

$$S = \int d\sigma^- d\sigma^+ \sqrt{-h} h^{ab} \omega_{\mu\nu} \partial_{(a} x^\mu \partial_{b)} y^\nu$$

$\omega_{\mu\nu} \equiv$  Kinematic space metric

$\frac{SO(2,2)}{SO(1,1) \times SO(1,1)}$  invariant!

# Fidelity susceptibility

## Infinitesimally close causal diamonds:

- Causal diamonds at  $(x^\mu, y^\mu)$  and  $(x^\mu + \delta x^\mu, y^\mu + \delta y^\mu)$
- Density matrices:  $\rho$  and  $\rho + \delta\rho$
- Parallel purifications:  $\psi$  and  $\psi + \delta\psi$  [Uhlmann'86]

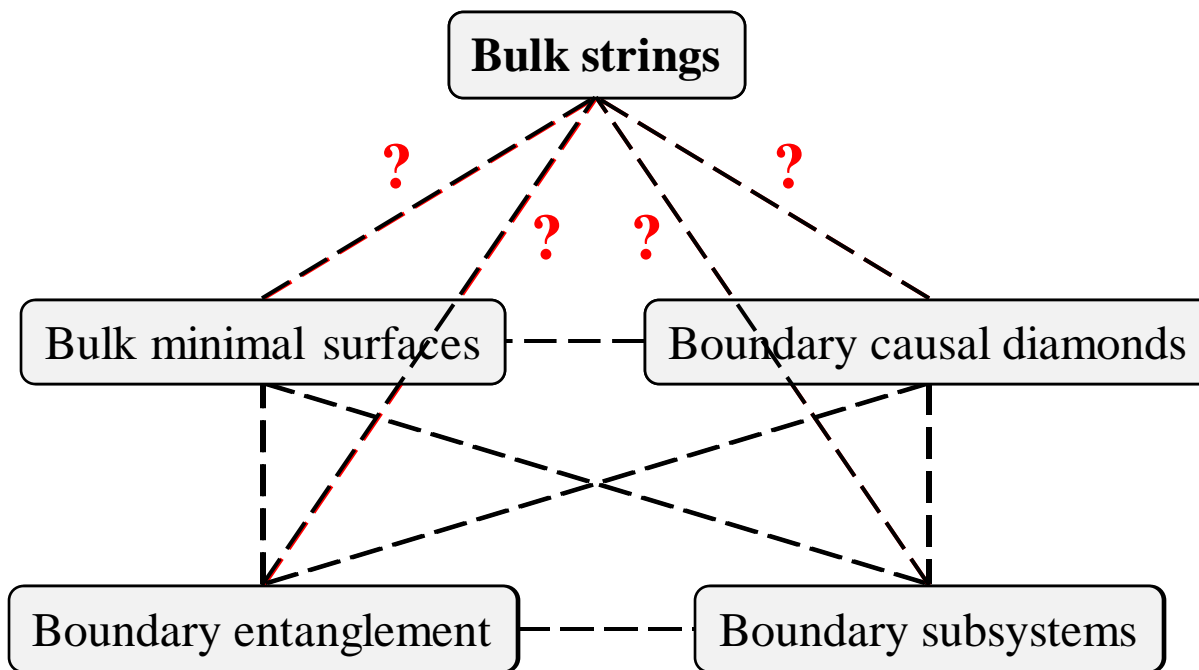

## Fidelity susceptibility and complexity:

- Overlap of states:  $|\langle\psi|\psi + \delta\psi\rangle| = 1 - \omega_{\mu\nu}^{FS} \delta x^\mu \delta y^\nu + \dots$
- Where:  $\omega_{\mu\nu}^{FS}$ : **fidelity susceptibility**
- Kinematic space metric  $\omega_{\mu\nu} \propto \omega_{\mu\nu}^{FS}$
- Where prefactors contain geometric factors and  $a_d^*$  trace anomaly

**Bulk string geometry ↔ Boundary quantum geometry**

# Summary

## Summary:

- $AdS_3/CFT_2$  correspondence
- Ryu-Takayanagi formula  $\rightarrow$  Connection between surfaces of **segmented strings**, areas of **minimal surfaces** and entanglement entropies of **subsystems** in CFT vacuum
- Geometry of classical strings  $\leftrightarrow$  Field theoretical entanglement
- Dictionary: Eg.:
  - Positivity of area  $\leftrightarrow$  Strong subadditivity
- Duality for segmented strings in  $AdS_{d+1}/CFT_d$ , if  $d = \text{even}$
- Continuous limit  $\leftrightarrow$  Quantum geometry

## Outlook:

- Entanglement as a glue?
- $CFT$  excitations?
- Further entanglement inequalities?

# THANK YOU FOR YOUR ATTENTION!
