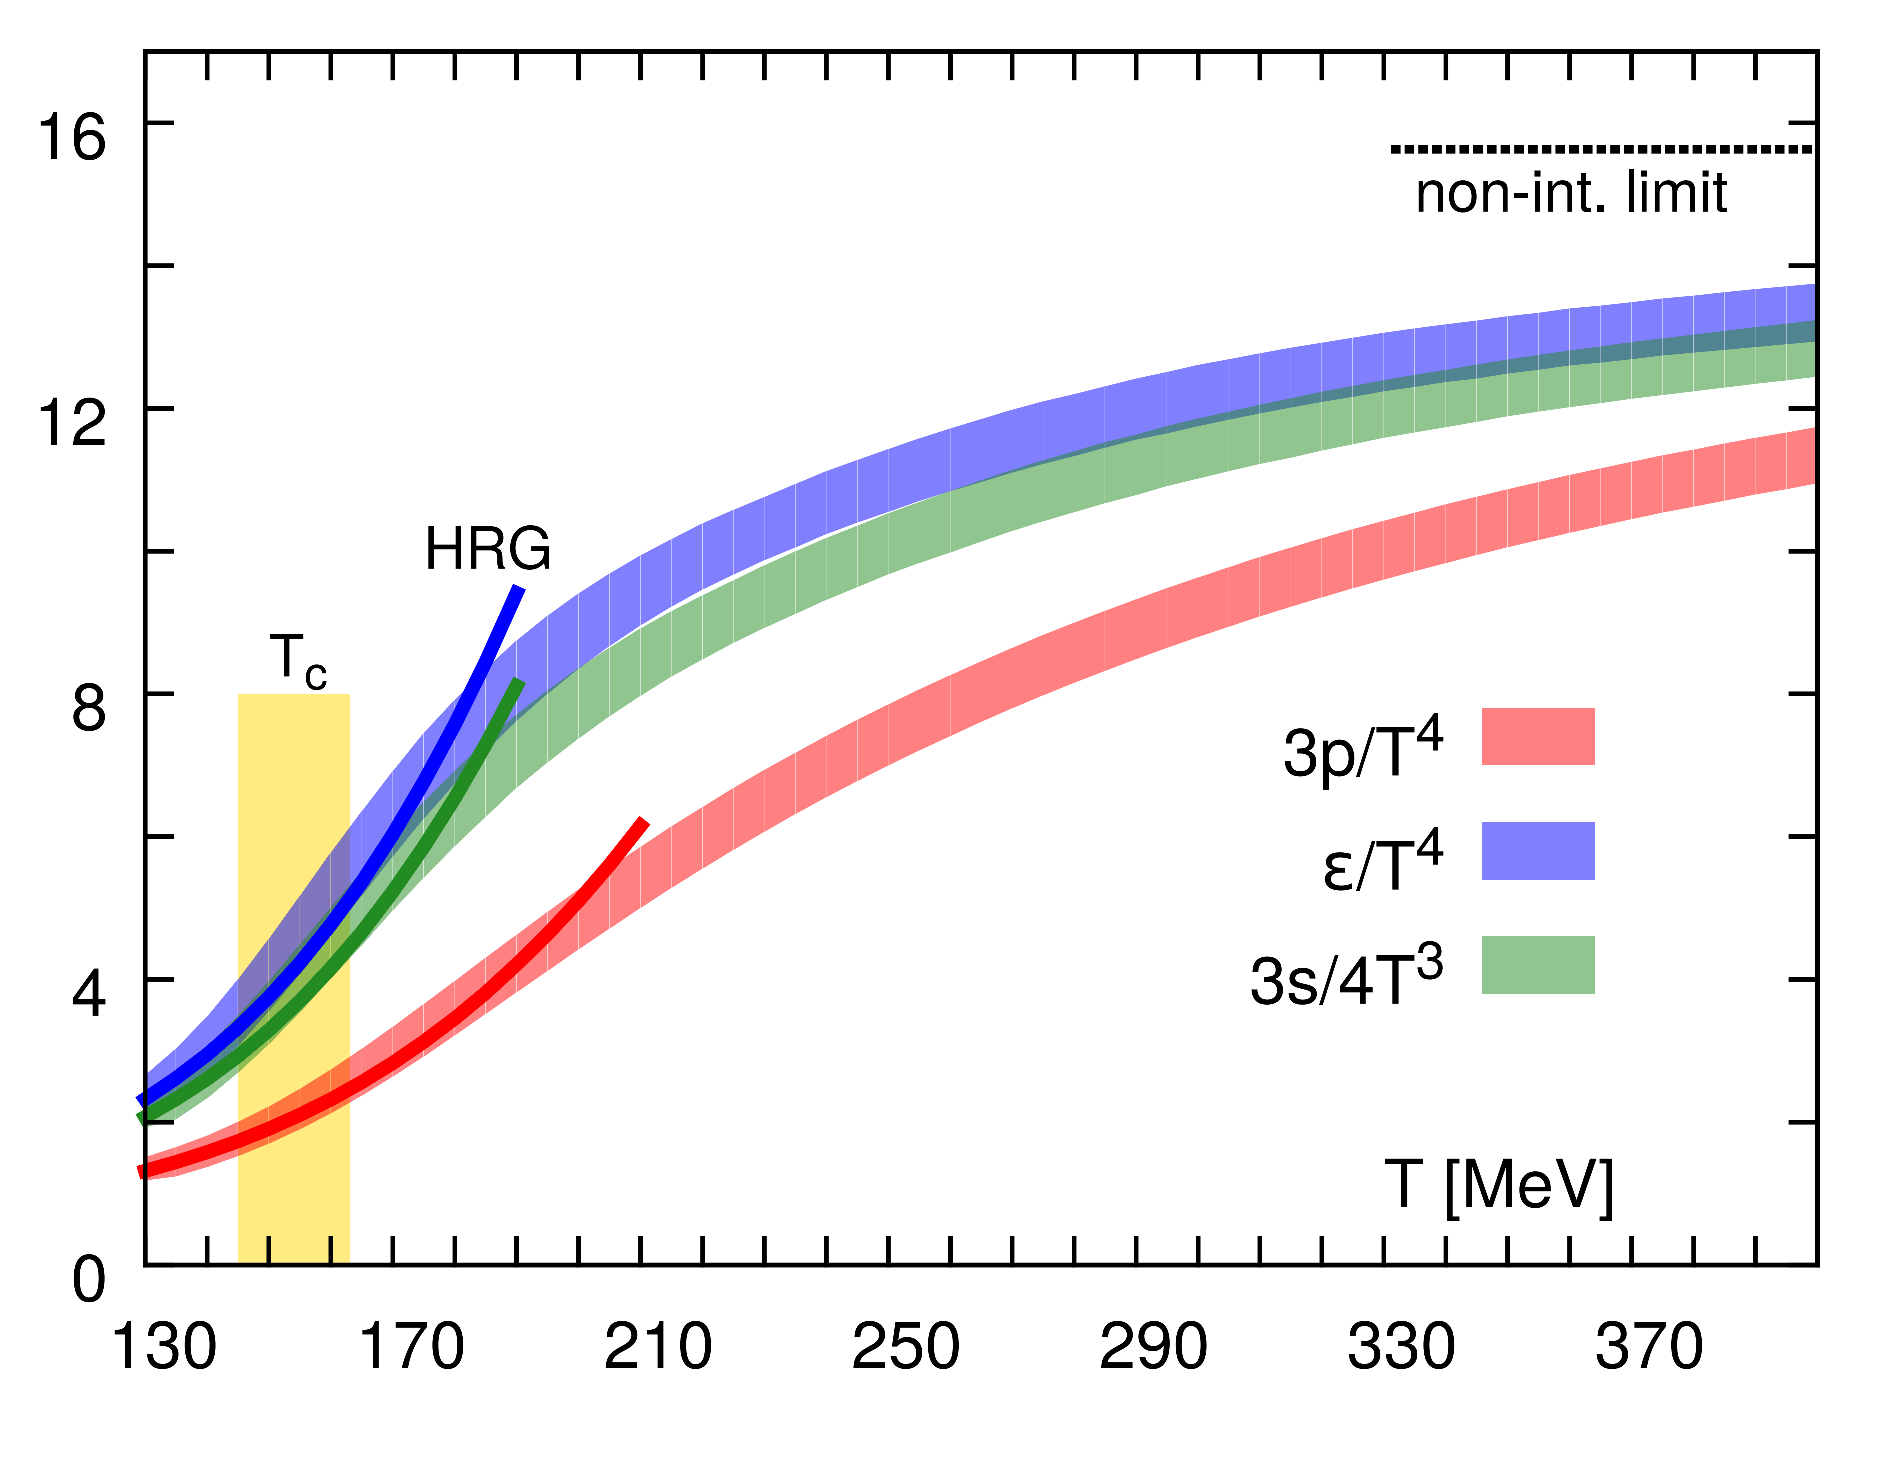
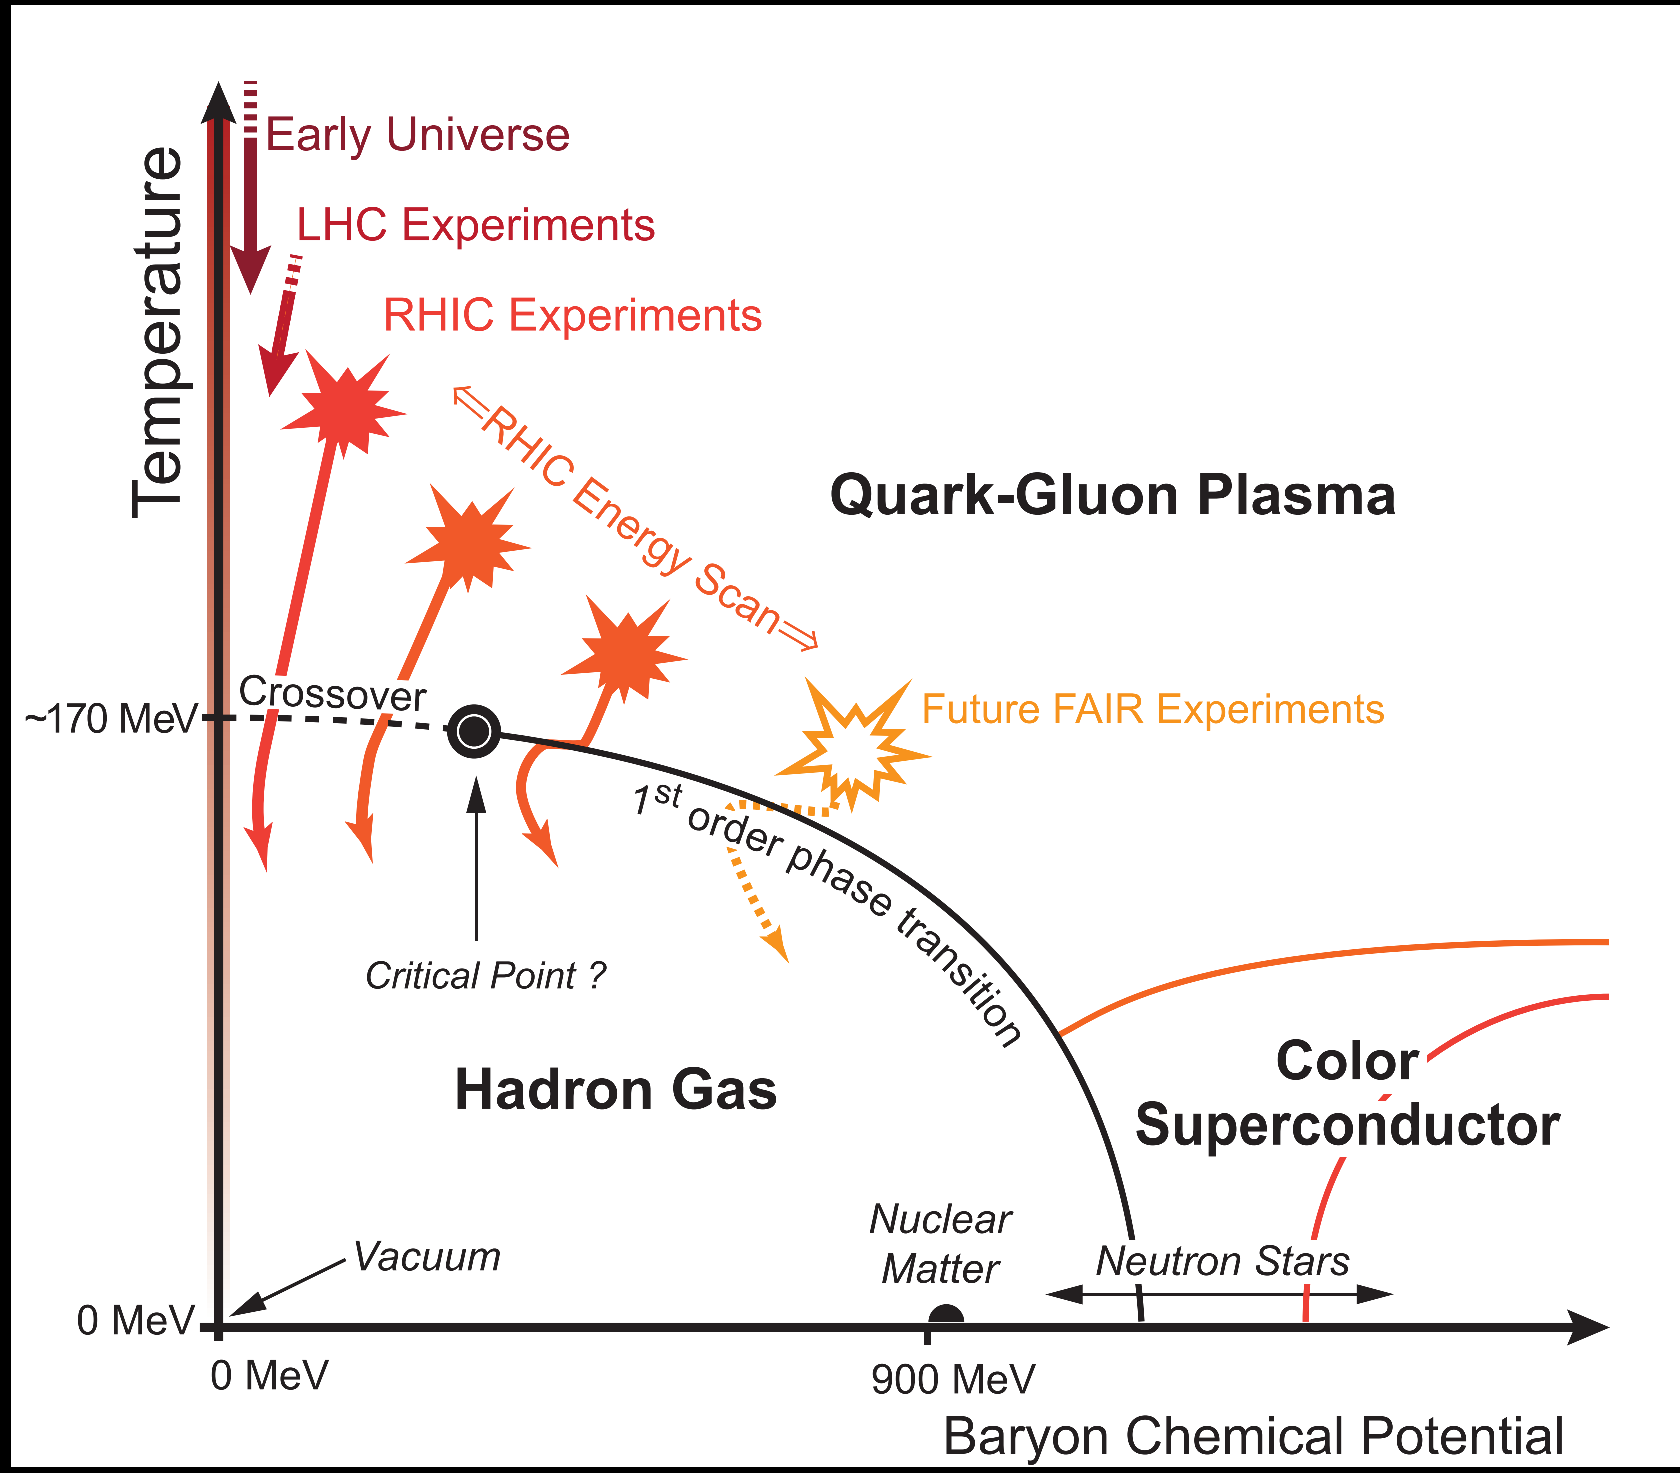
Do we understand what QCD tells us?

QCD and the Phase Diagram

- Lattice QCD predicts a phase transition to a quark gluon plasma at an energy density of about 1 GeV/fm³ and at a temperature of about ~10^{12} K



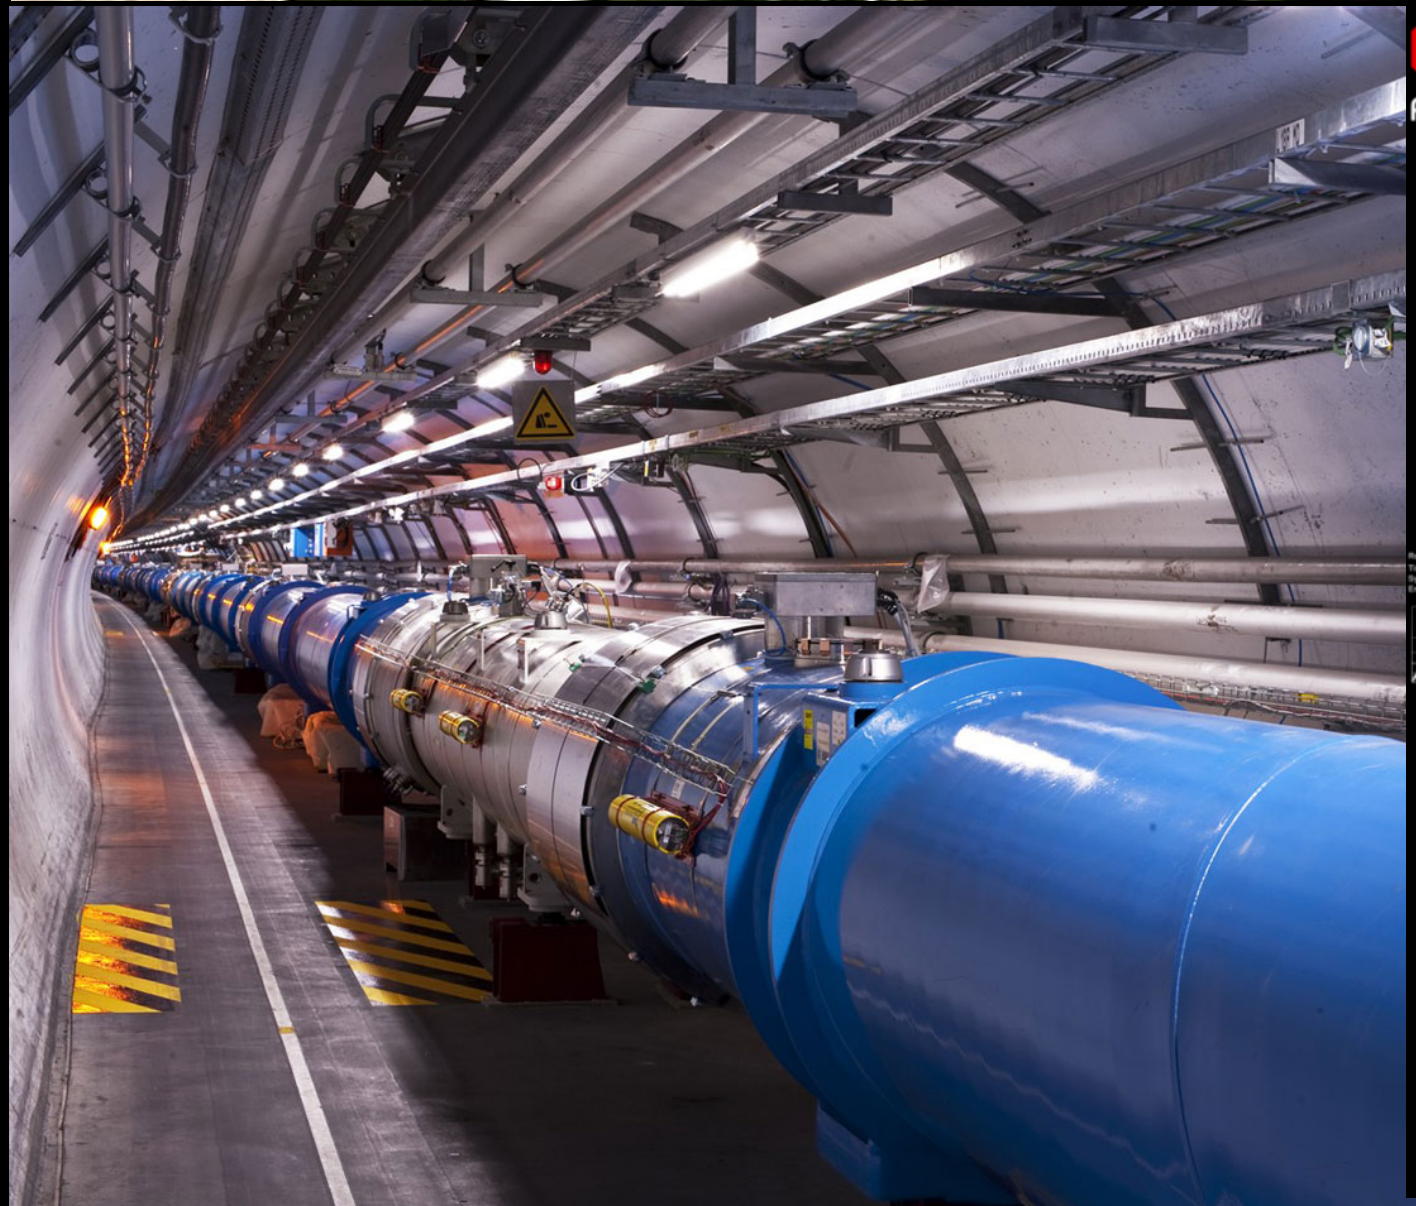


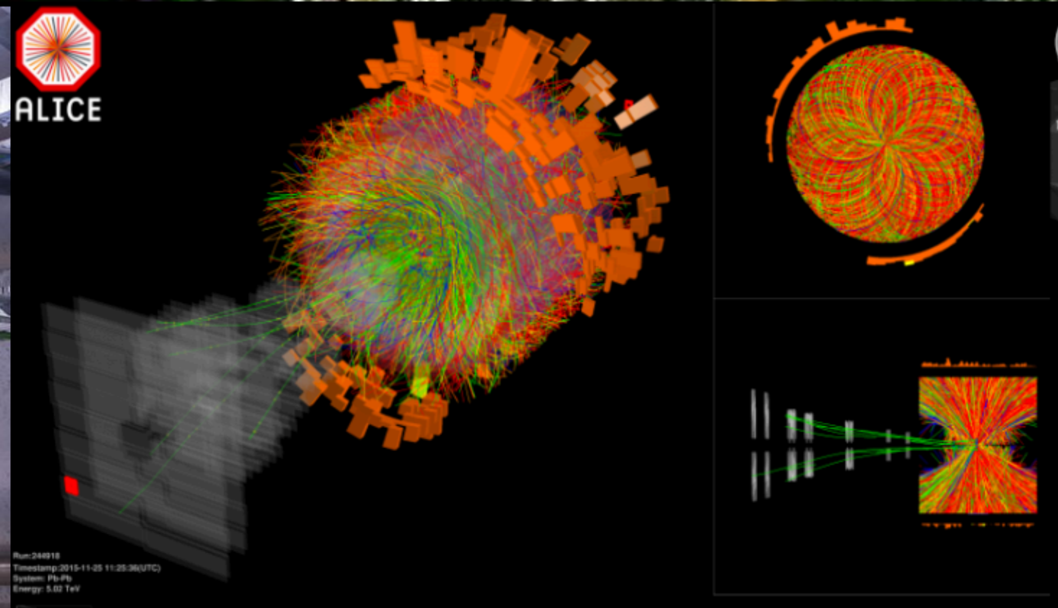
- Our current understanding of this new state of matter is very limited!

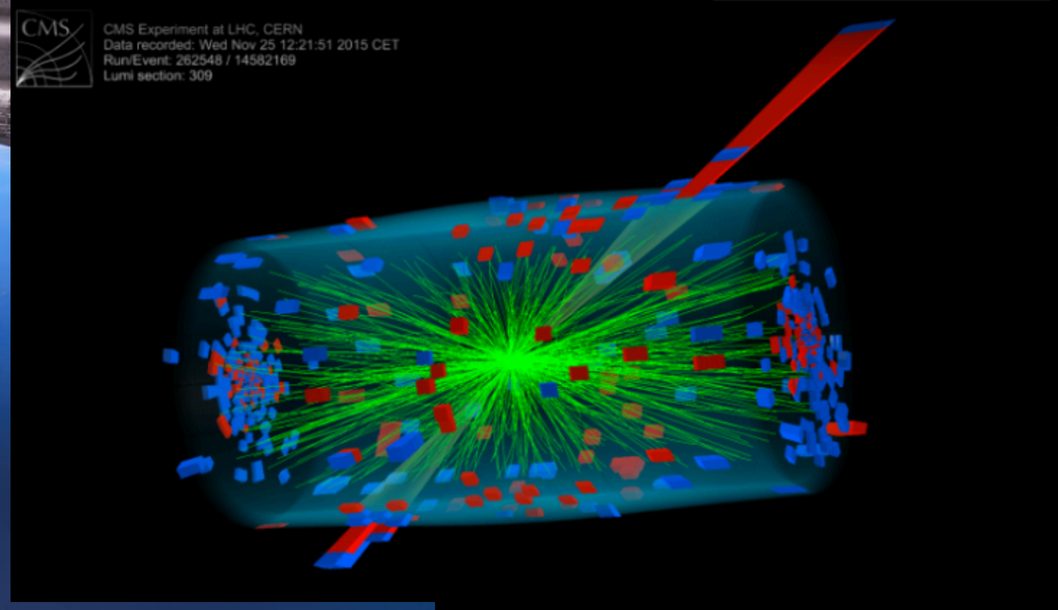
QCD and the Phase Diagram

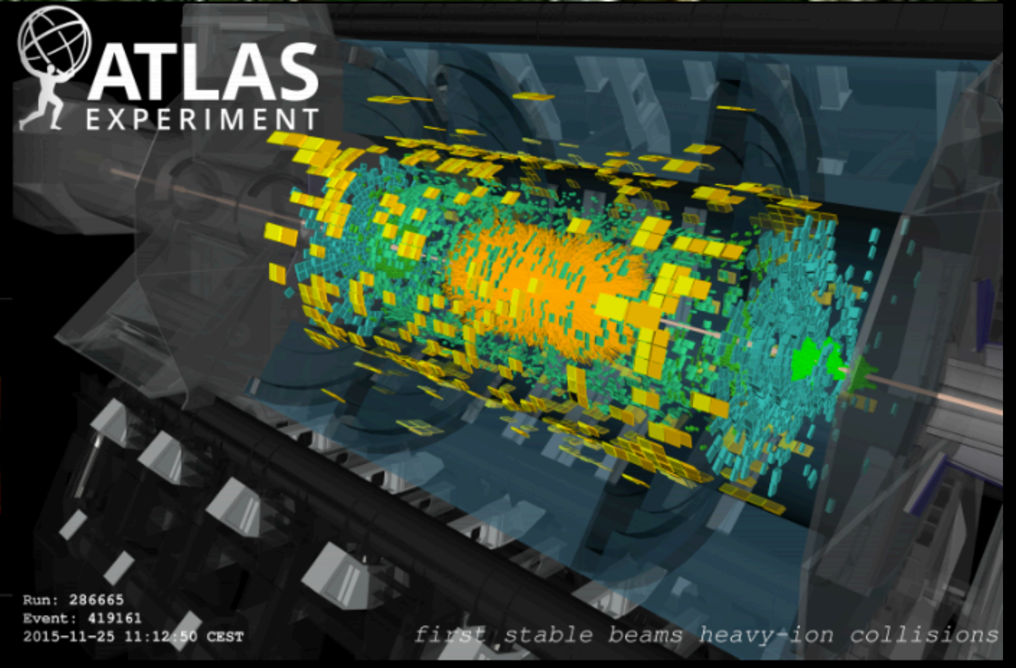
Experimental input needed to understand the phase-diagram

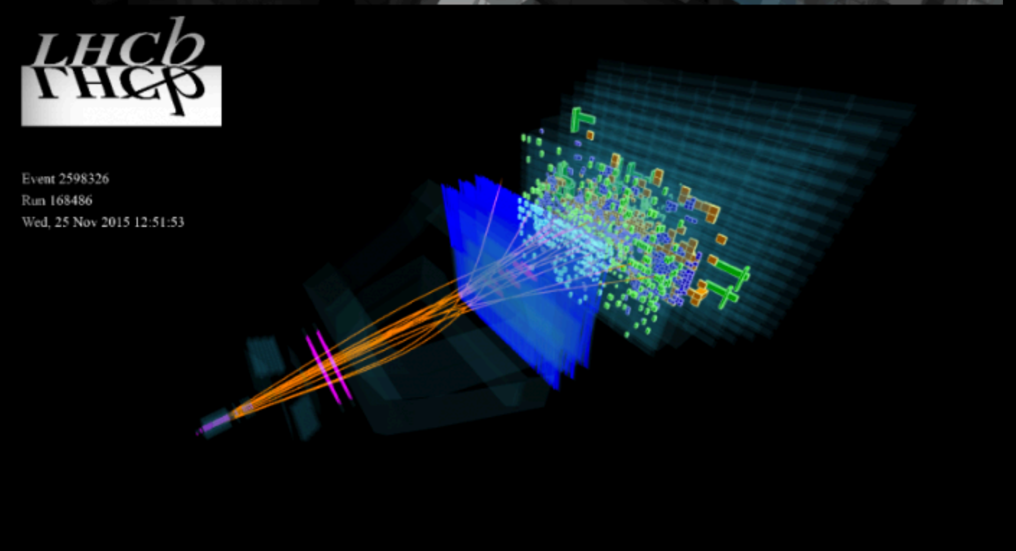
- Create a hot and dense system for which hydrodynamics/ thermodynamics applies
  - Collide heavy-ions at the highest possible energies
  - Measure what happens with state of the art experimental setups







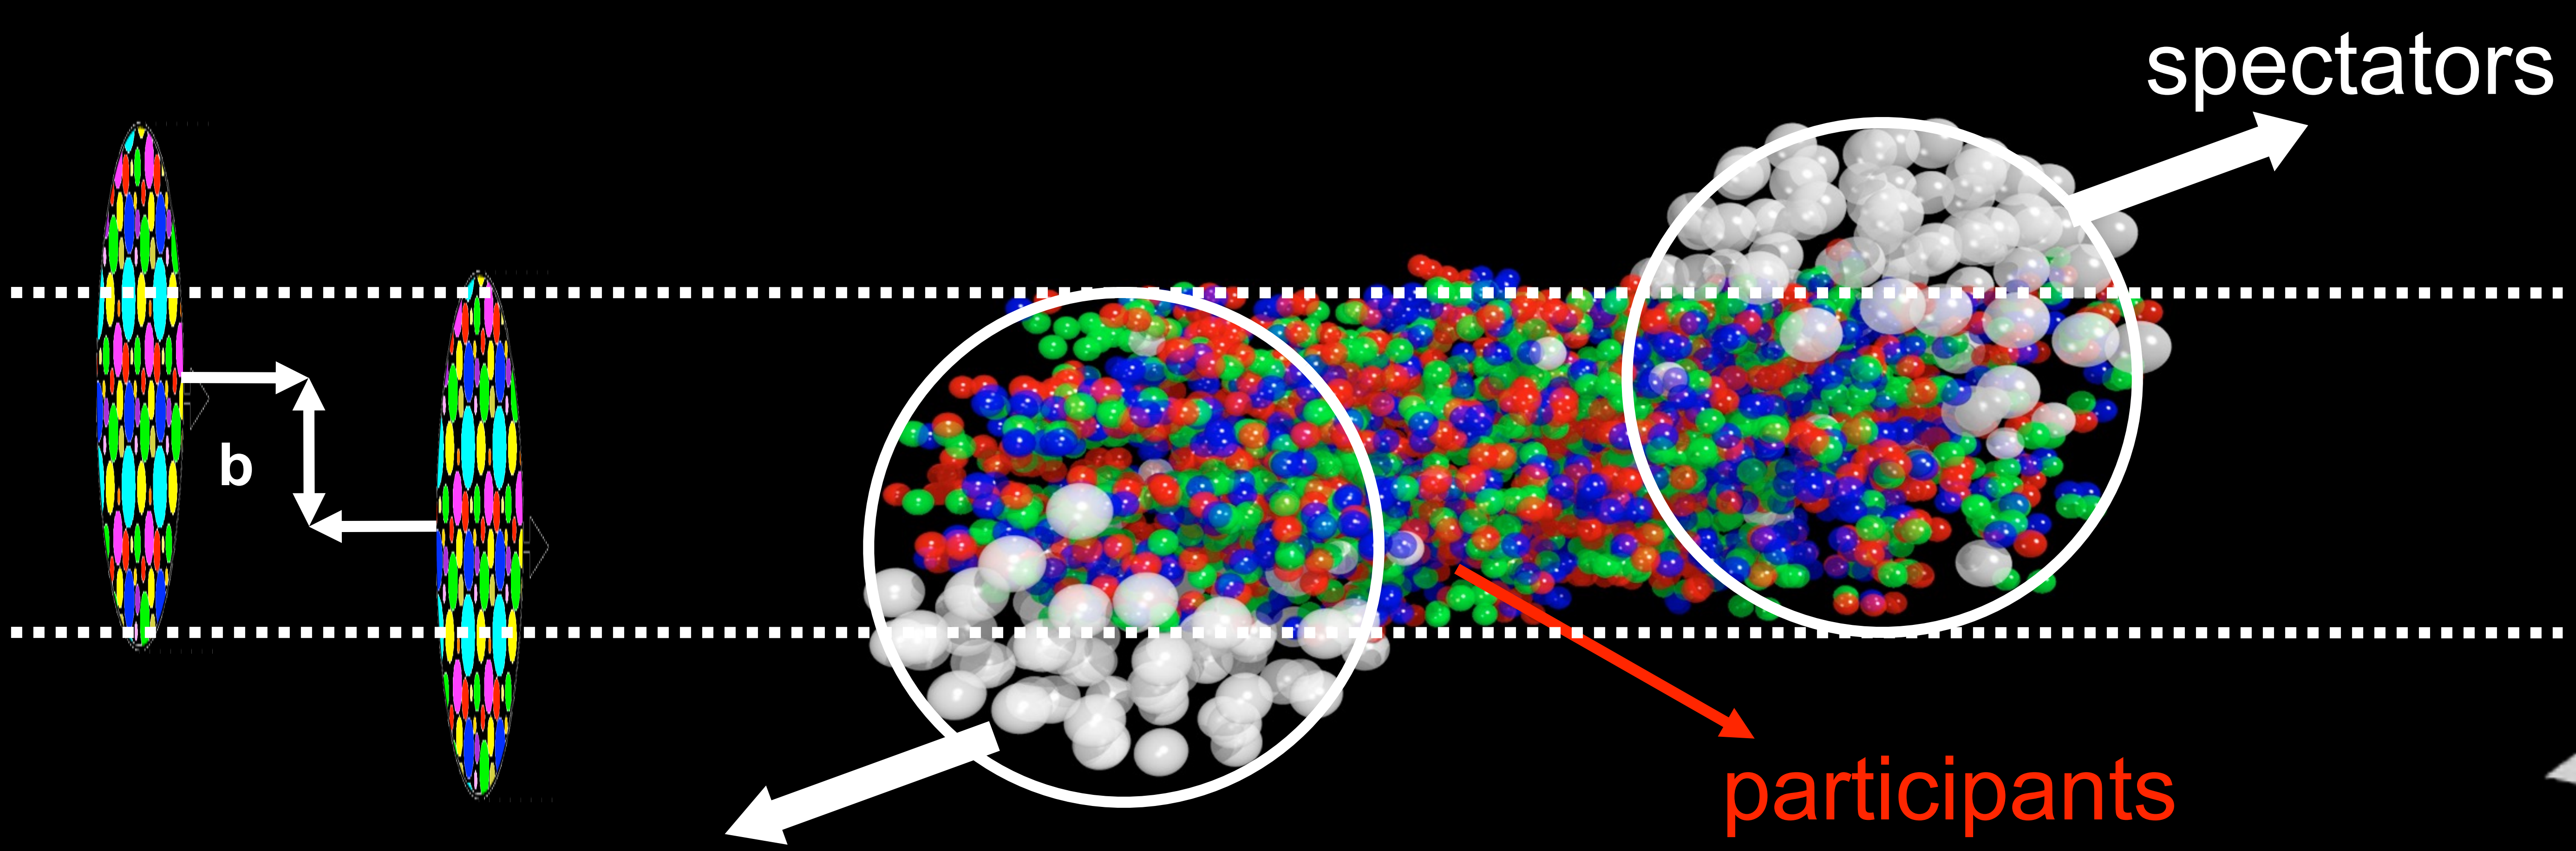


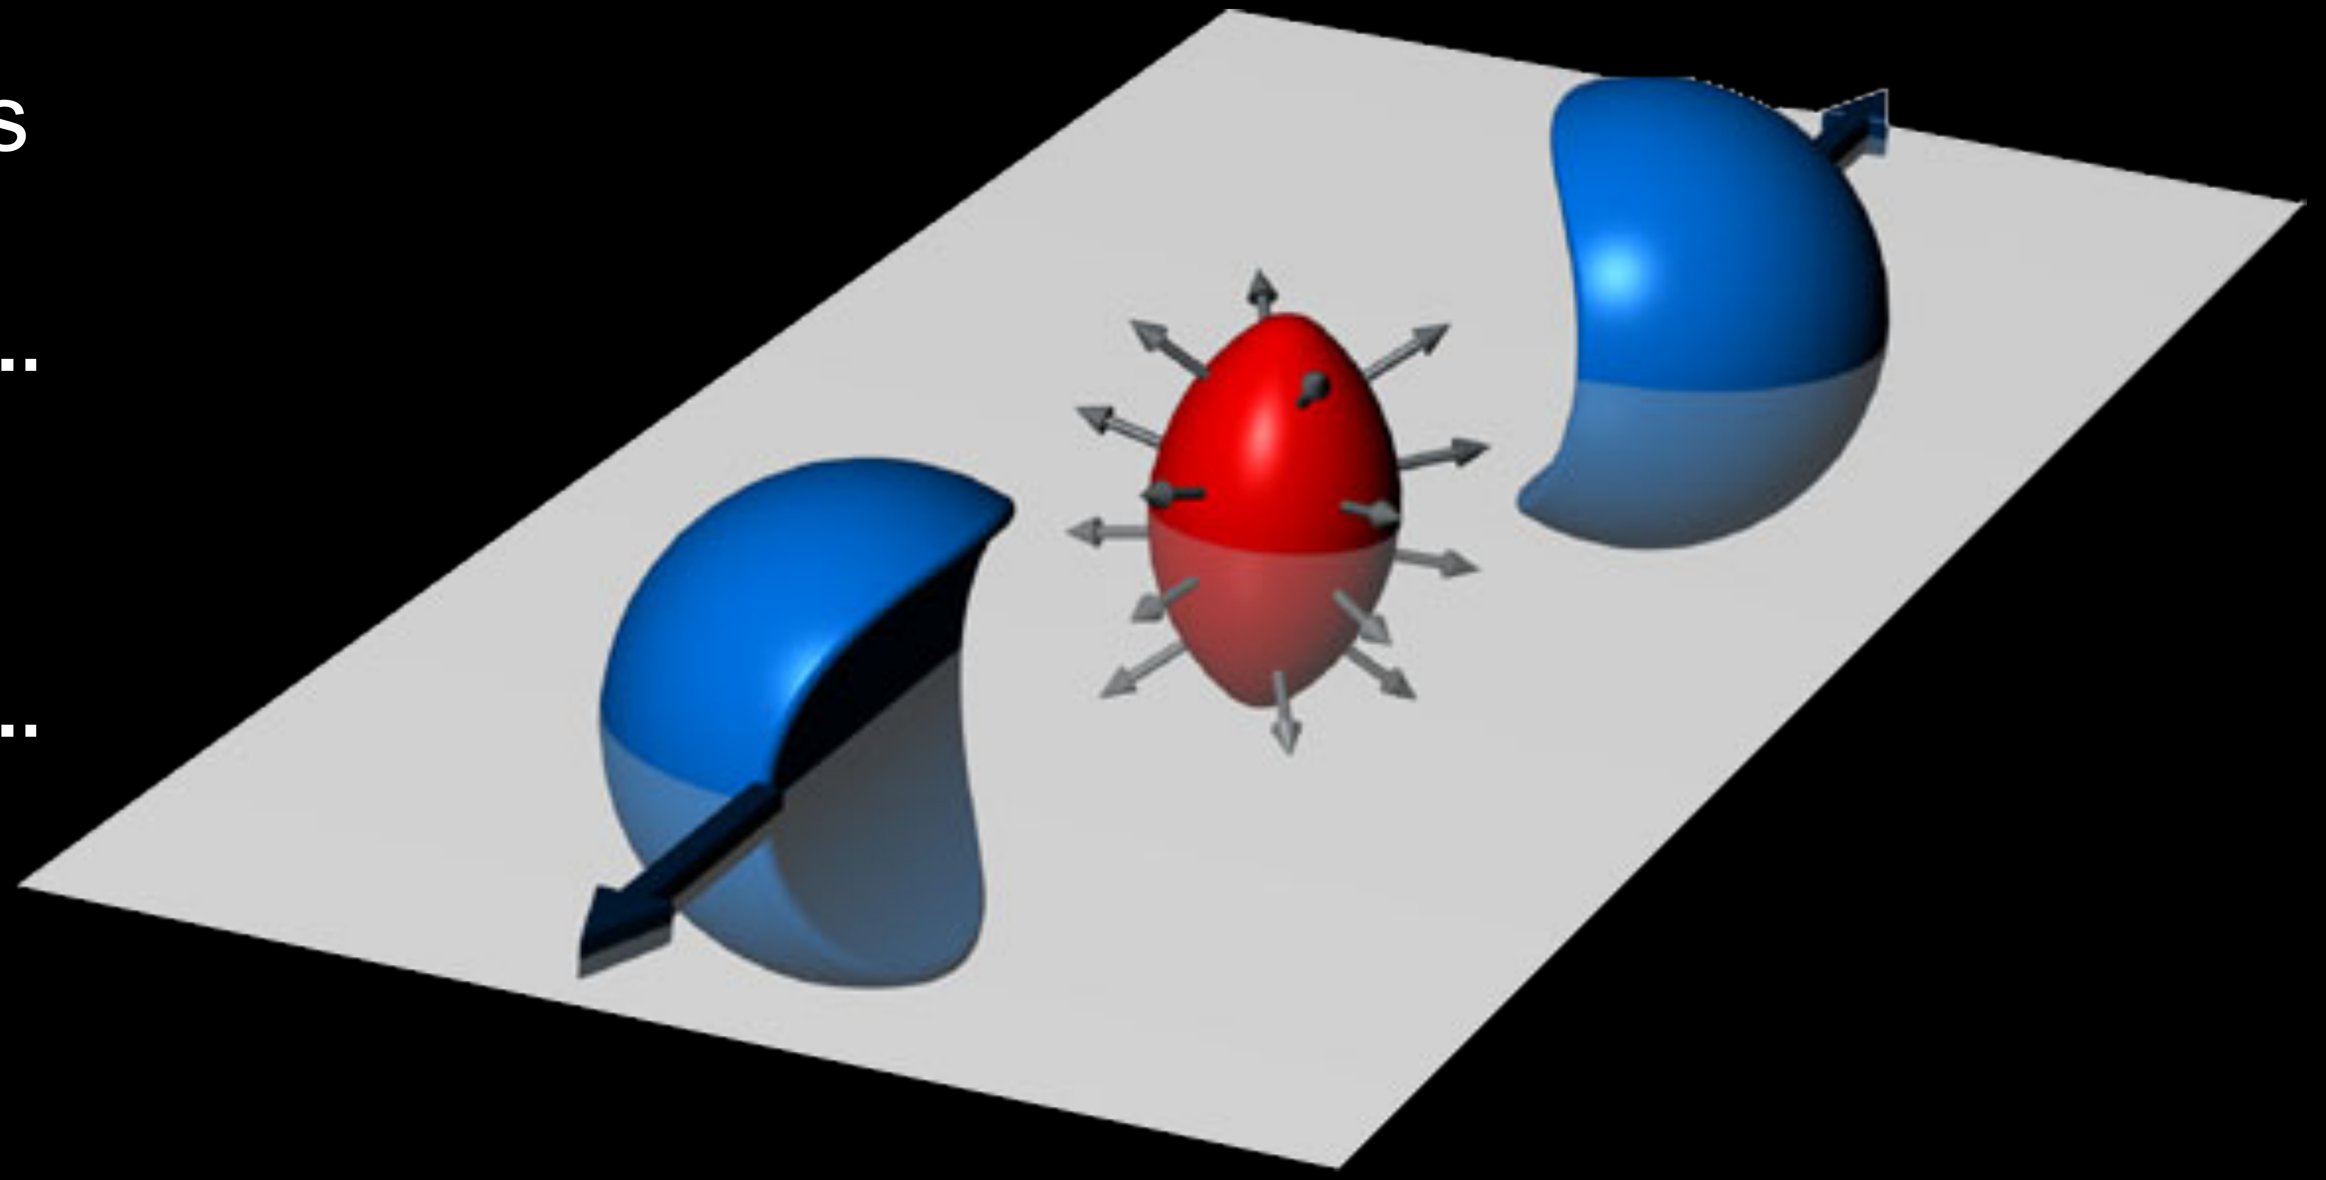


How to connect experimental observables to QCD predictions?

- Many of the properties of interest, some which are already calculable in QCD, are difficult or impossible to constrain directly from experimental observables
  - Created system and its evolution is too complicated to fully describe from first principles
- Need well understood control parameters
  - The spatial geometry of the created system turns out to be one of the best control parameters

cartoon of a heavy-ion collision





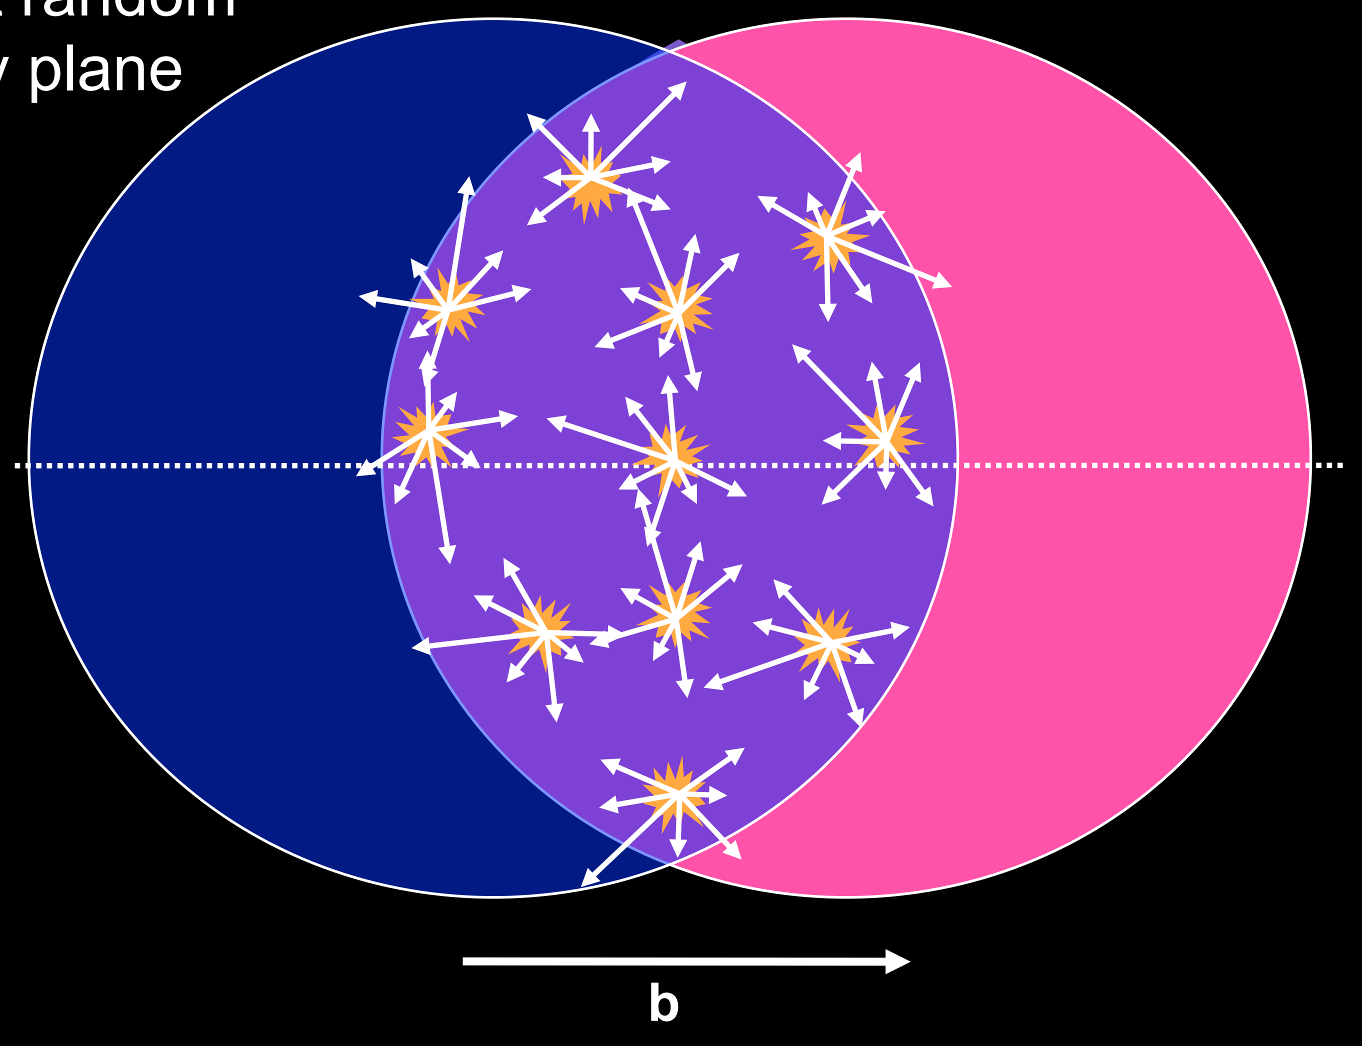
Spatial geometry in transverse plane

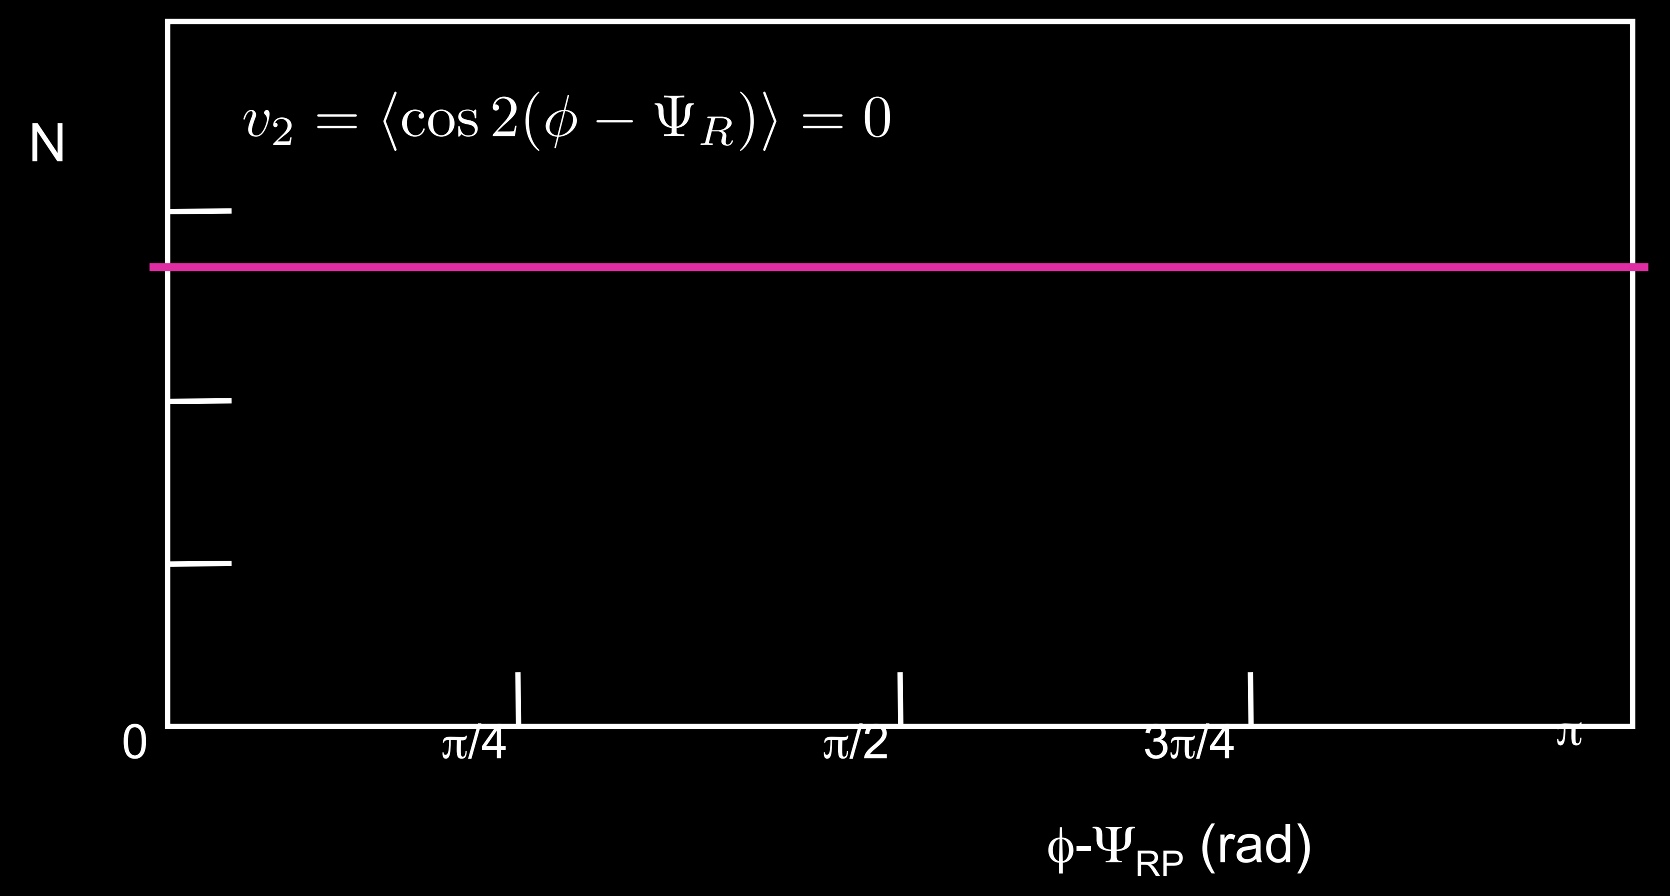
Spatial Geometry and Collective Flow

Ollitrault 1992

1) superposition of independent p+p:

momenta pointed at random relative to symmetry plane

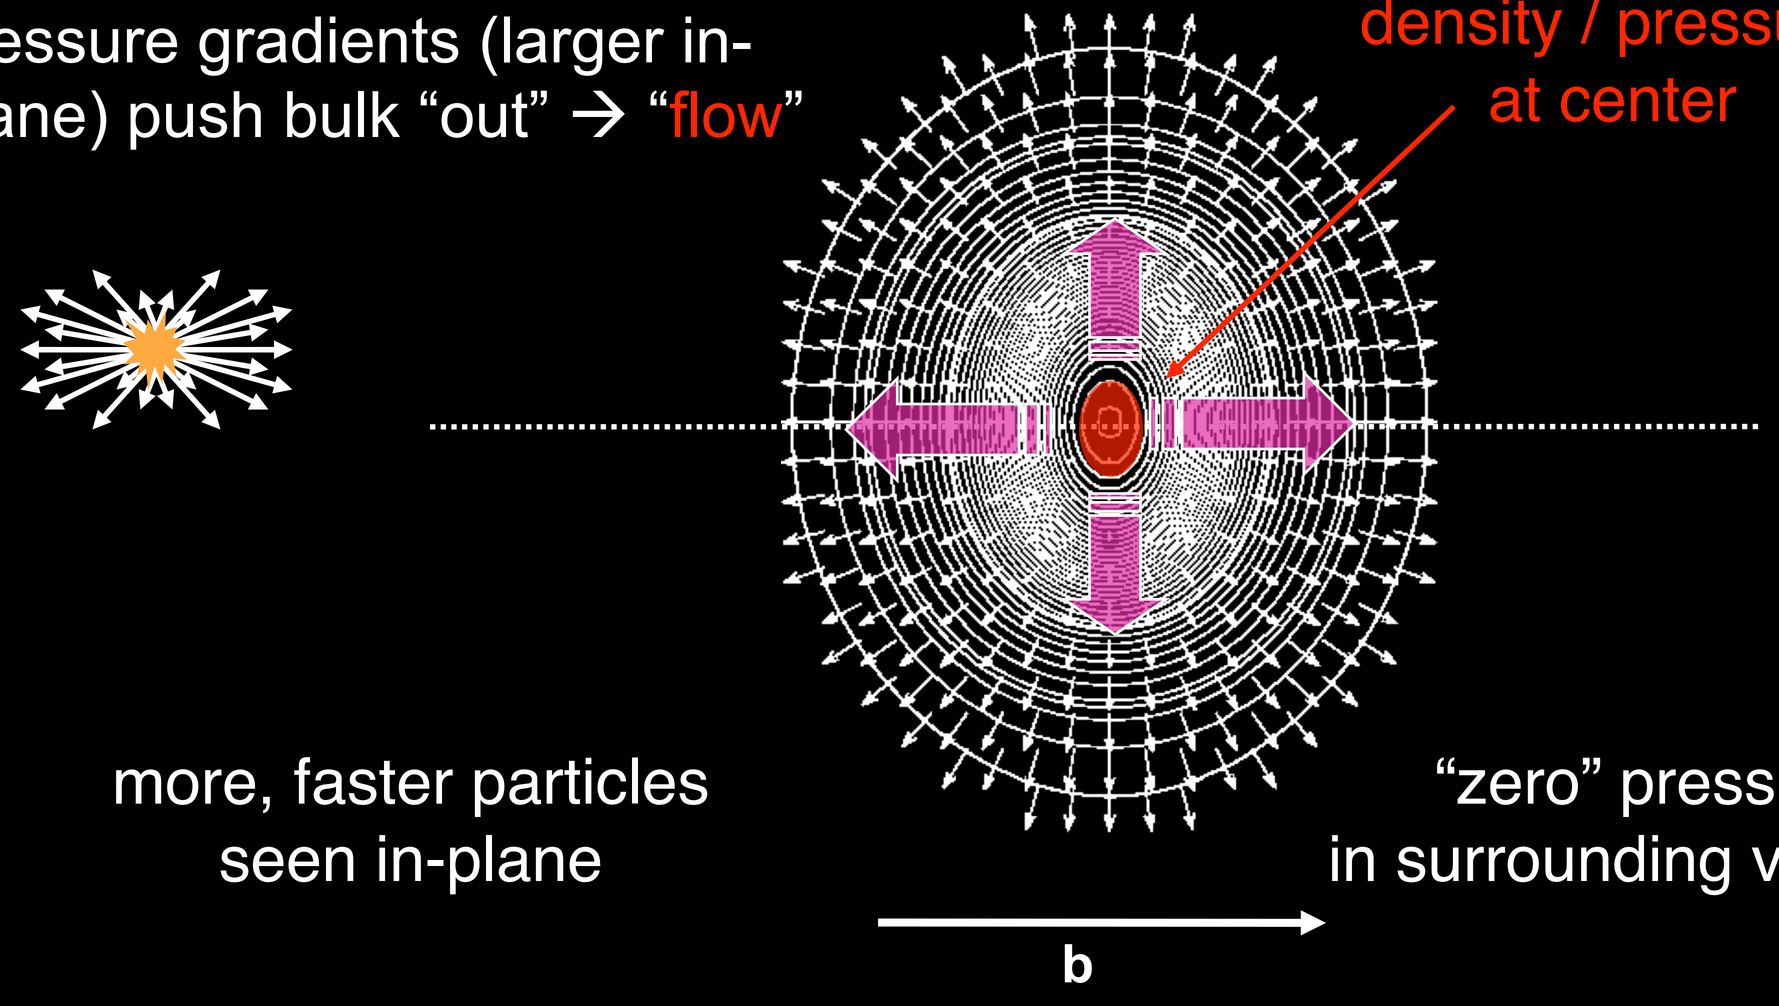




2) evolution as a **bulk system**

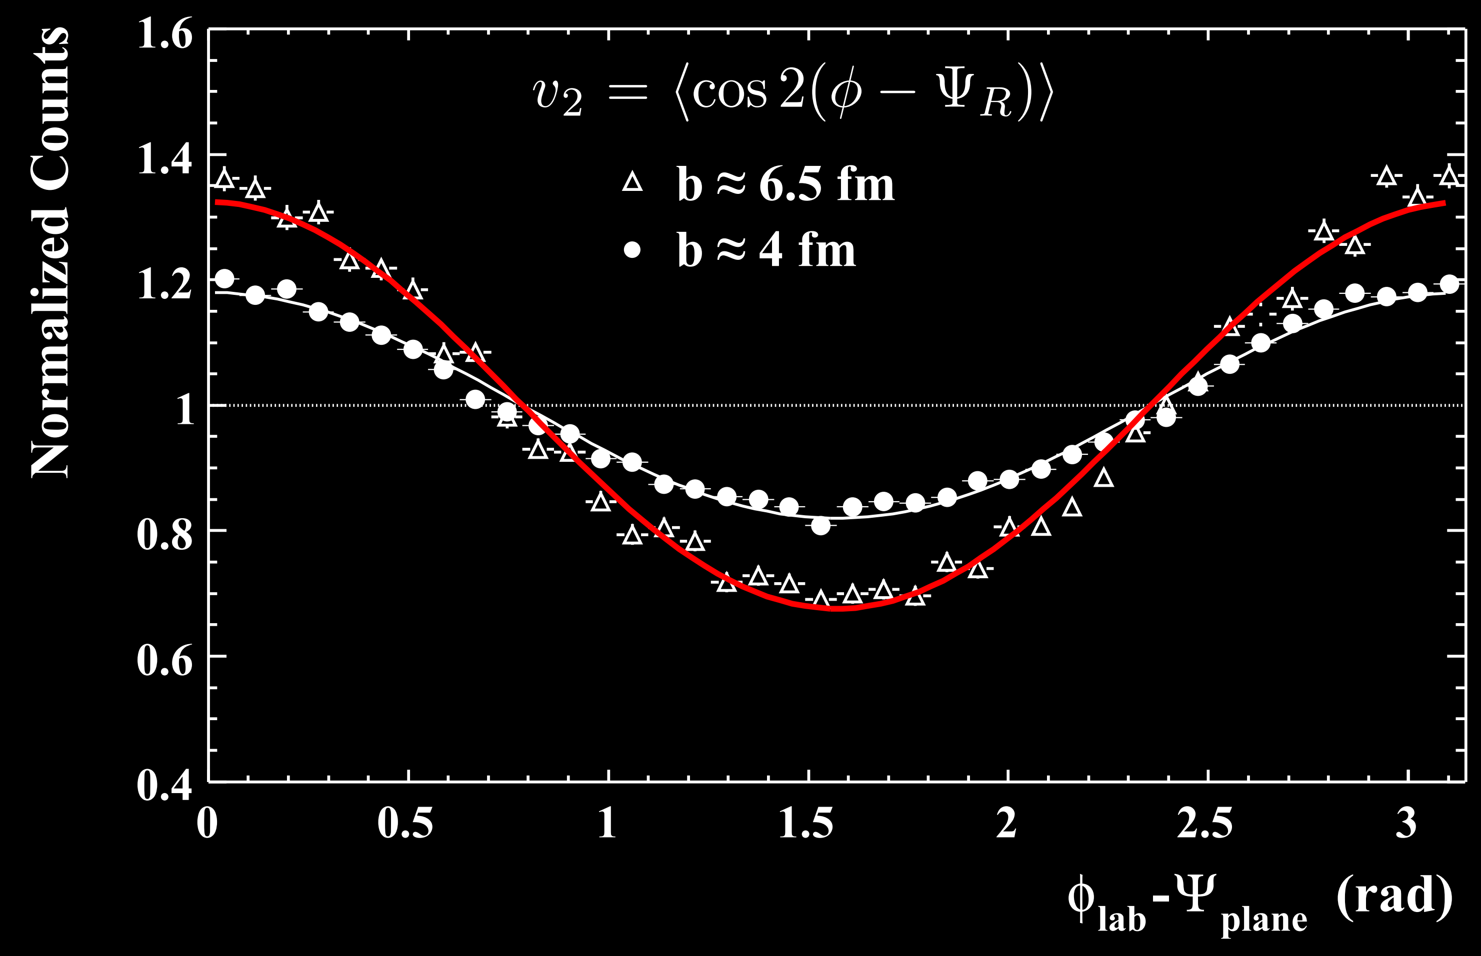
pressure gradients (larger in-plane) push bulk “out” → “flow”

high density / pressure at center

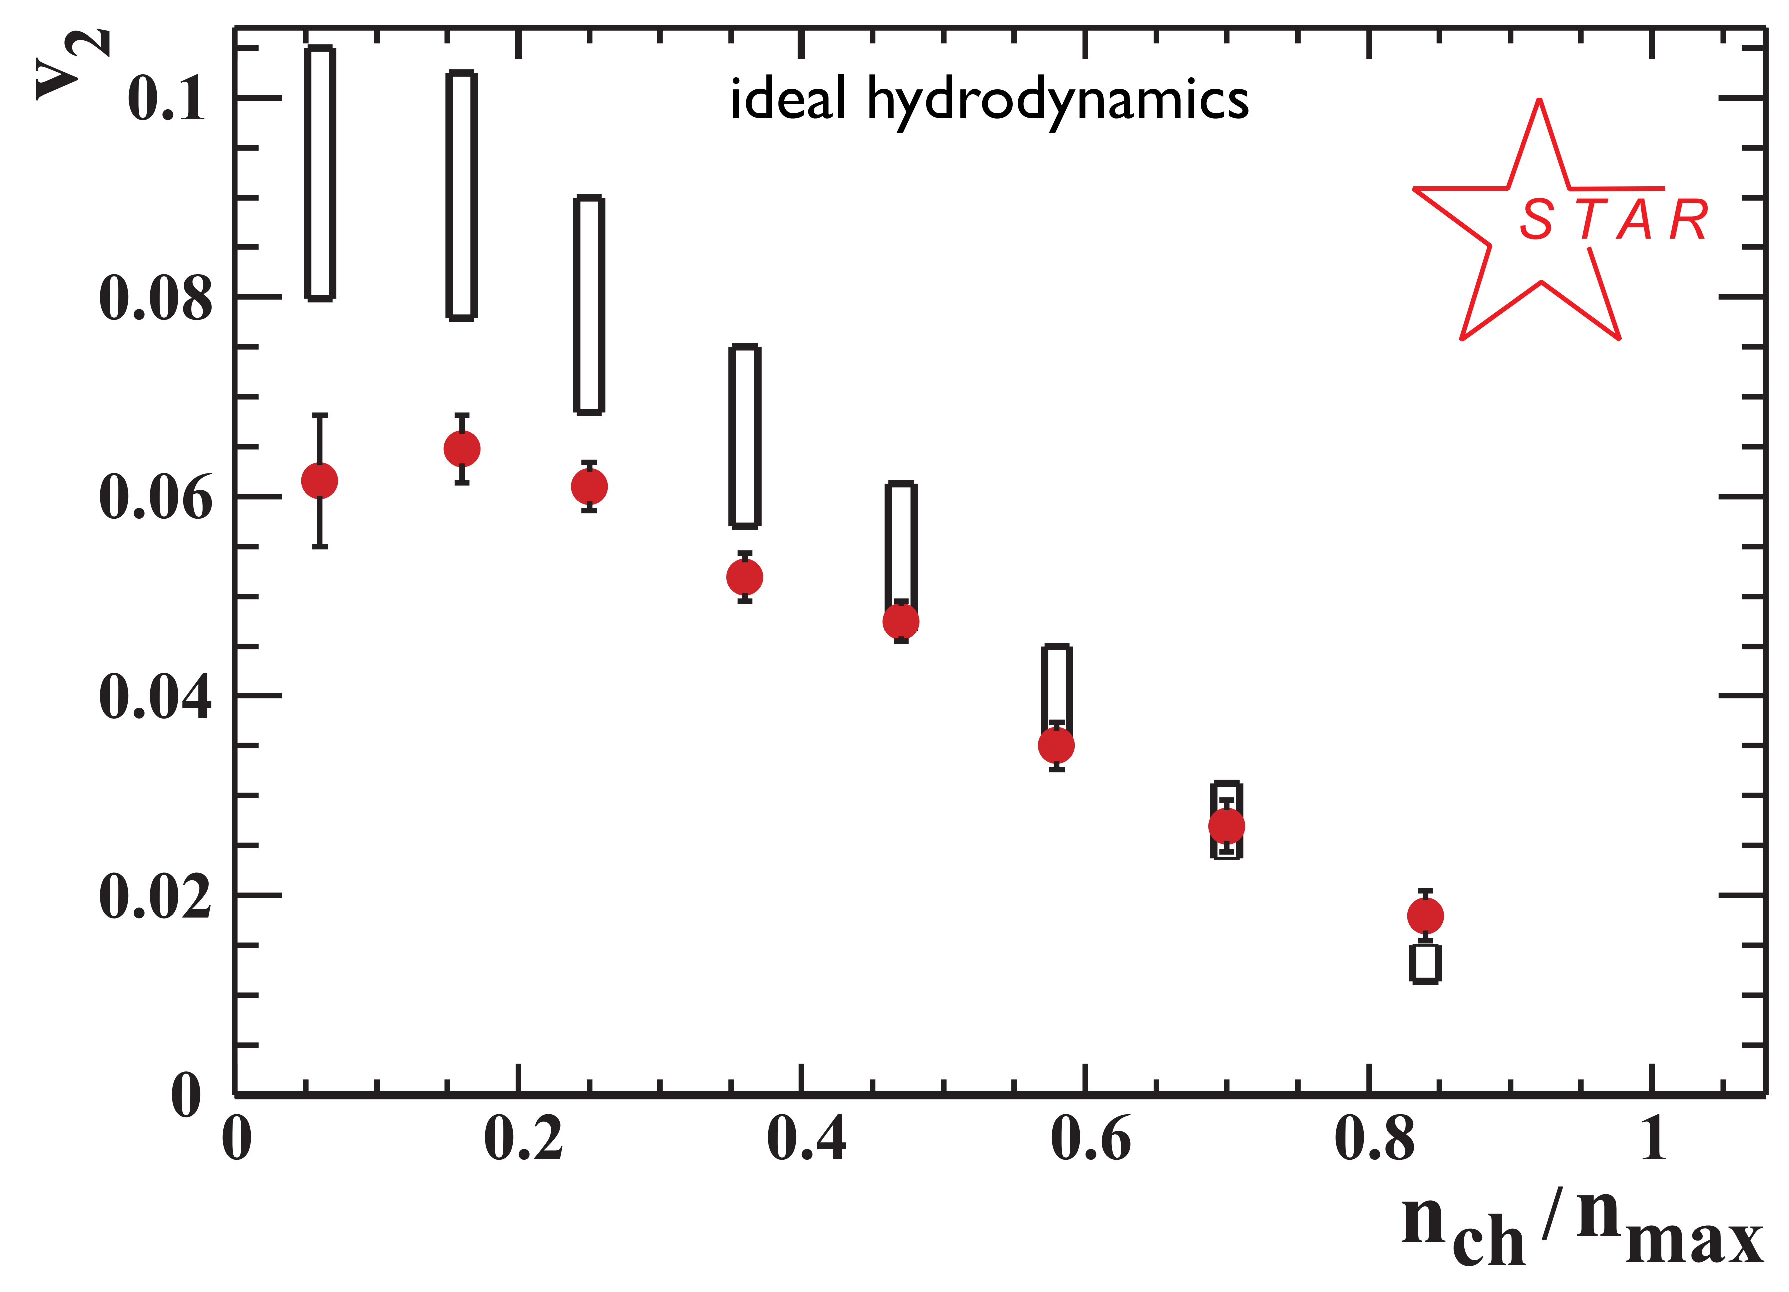


more, faster particles seen in-plane

“zero” pressure in surrounding vacuum



First measurements of Elliptic Flow at the LHC and the succes of a hydrodynamic description

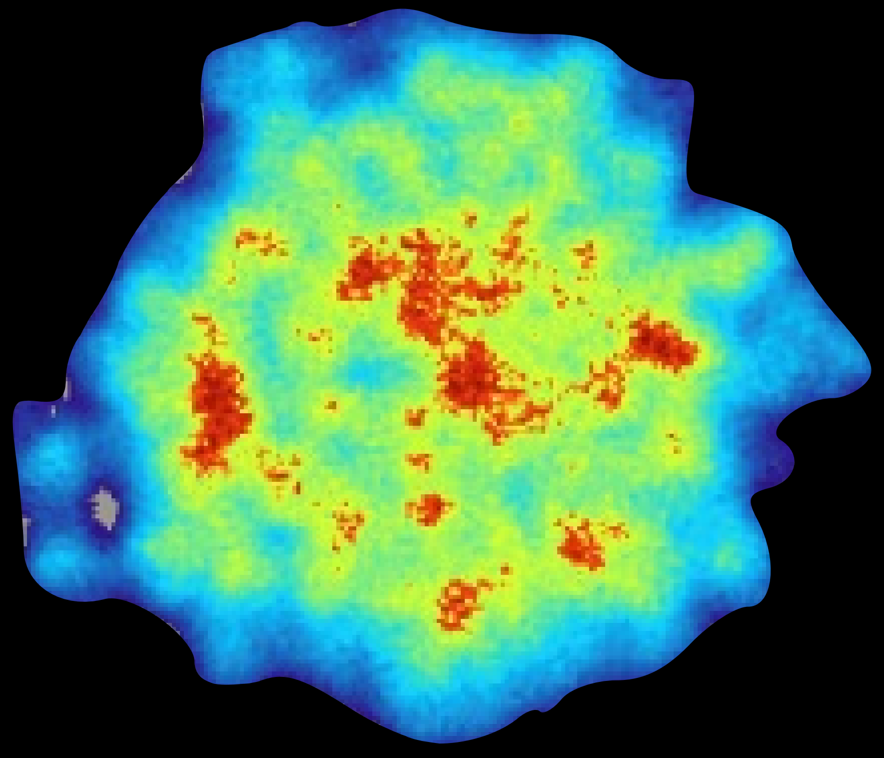


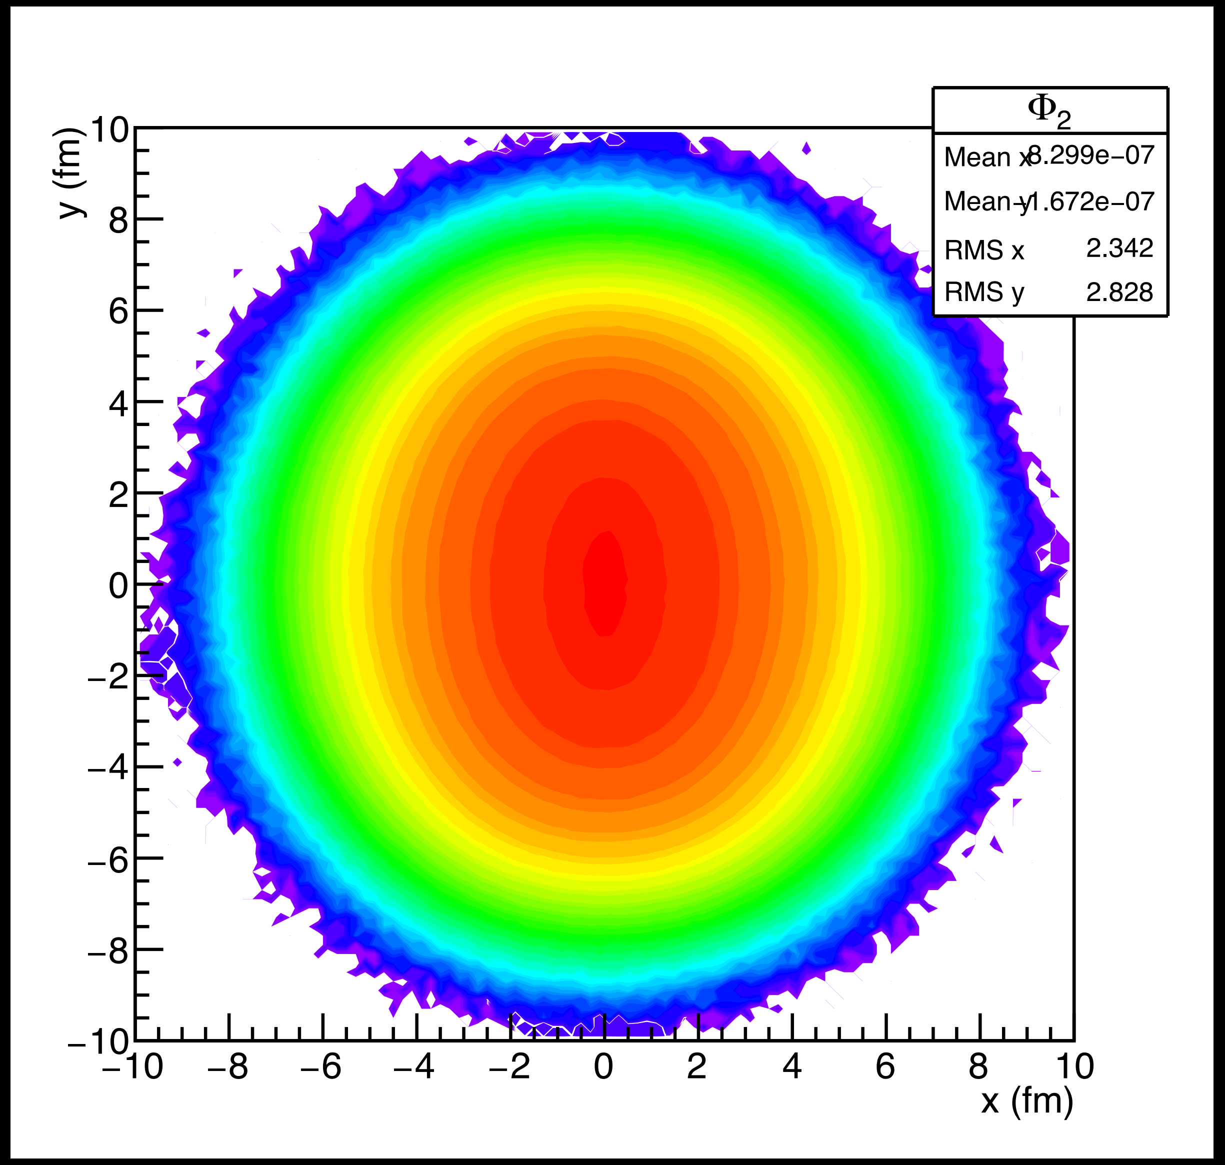
STAR Phys. Rev. Lett. 86, 402–407 (2001)

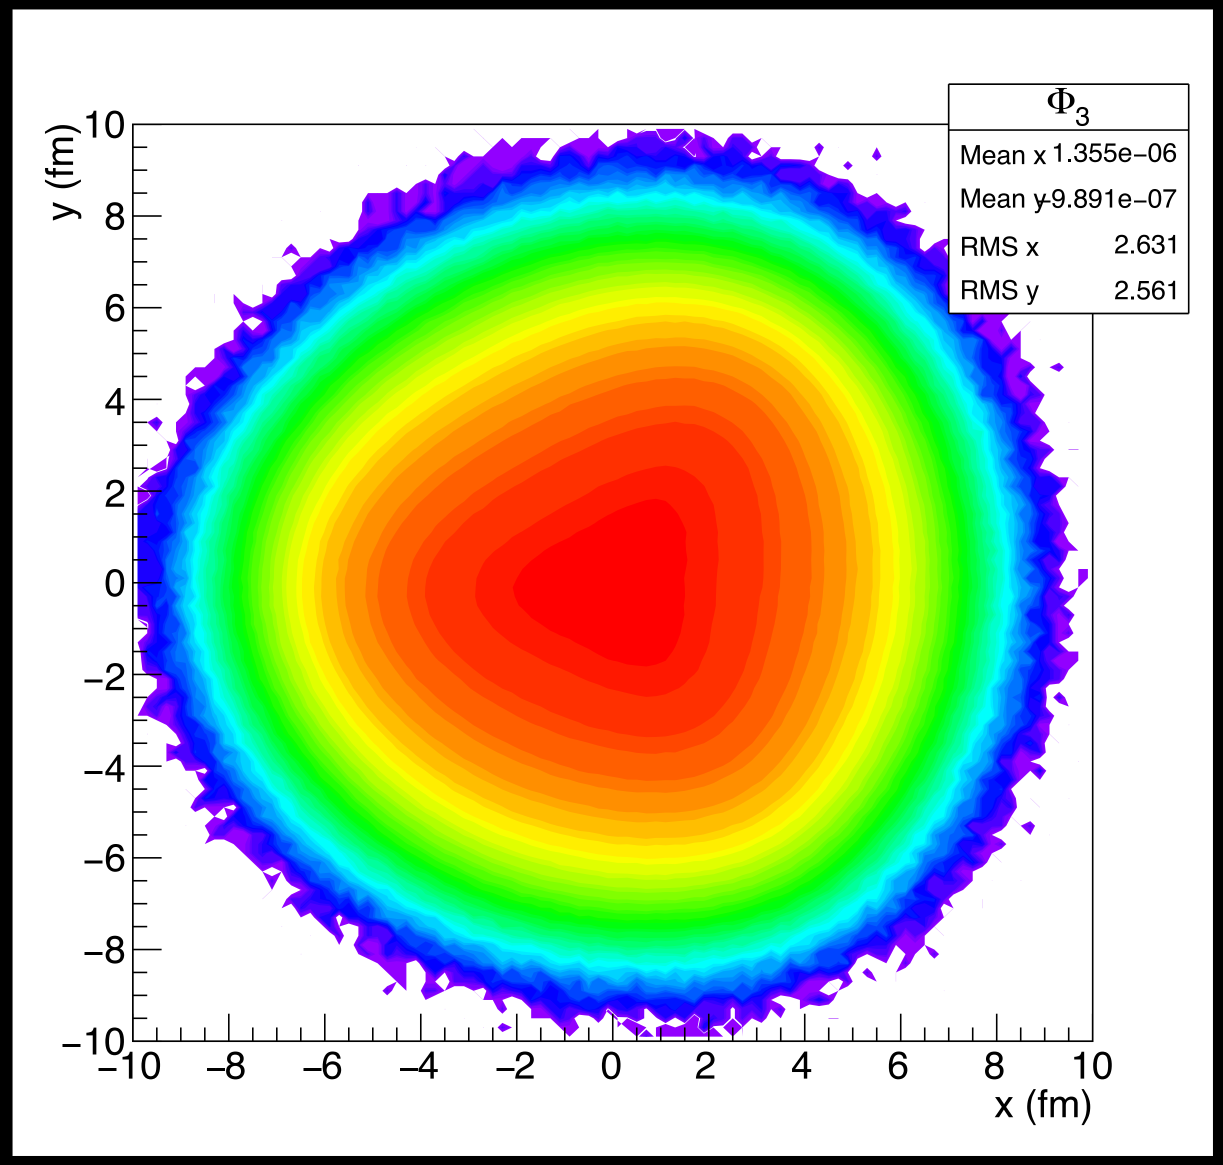
R.S., S.Voloshin, A. Poskanzer (Berkeley 2001)

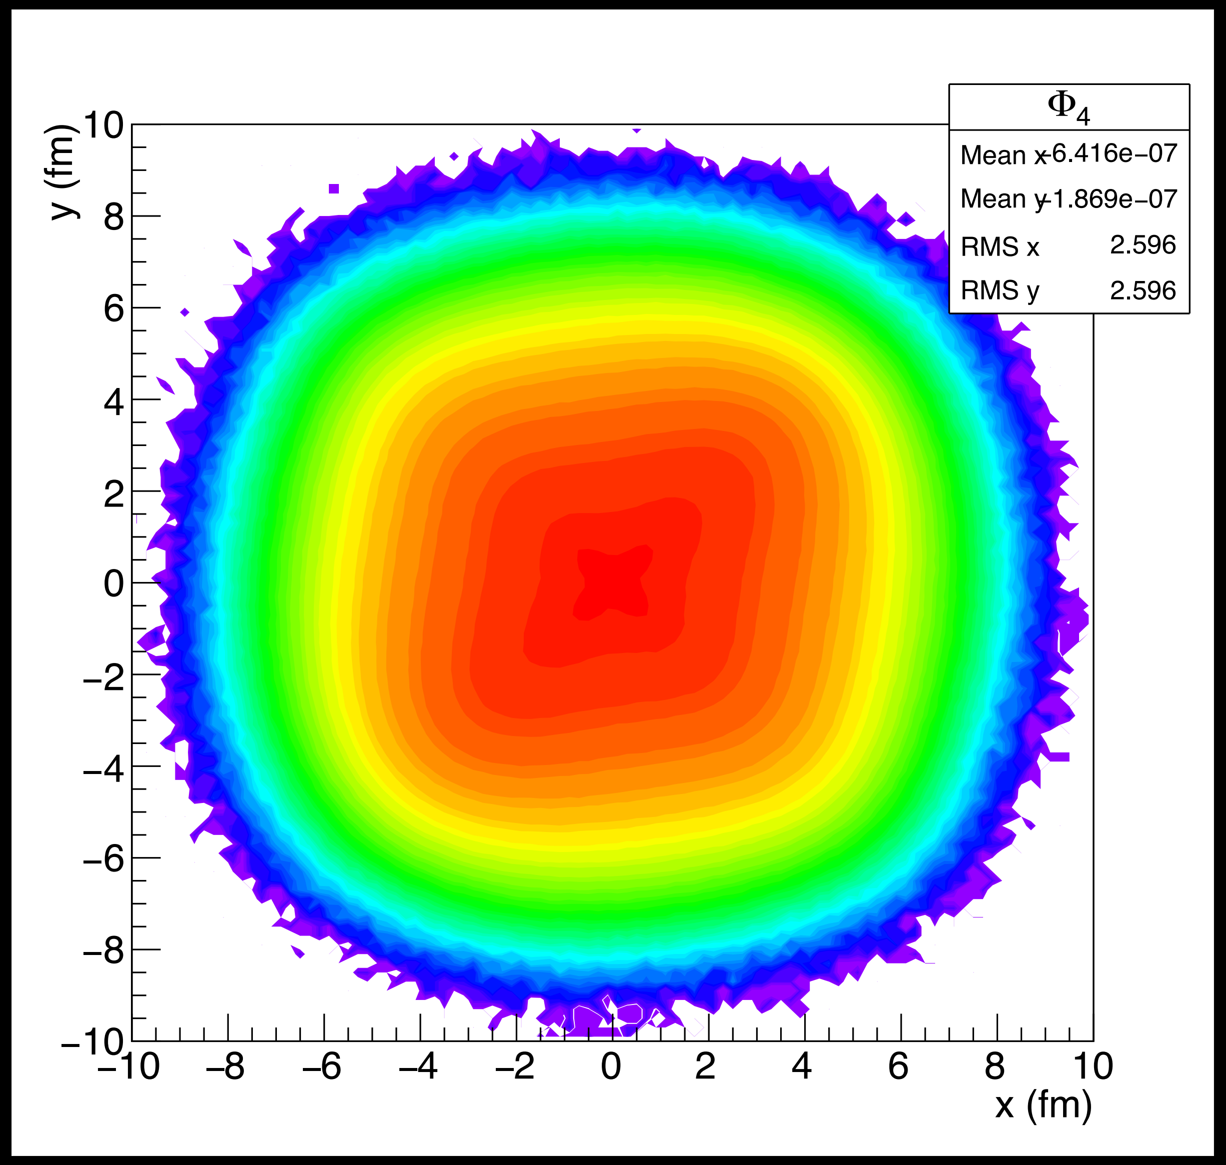
- for more central collisions magnitude of v_2 described by ideal hydro

Spatial geometry in the transverse plane



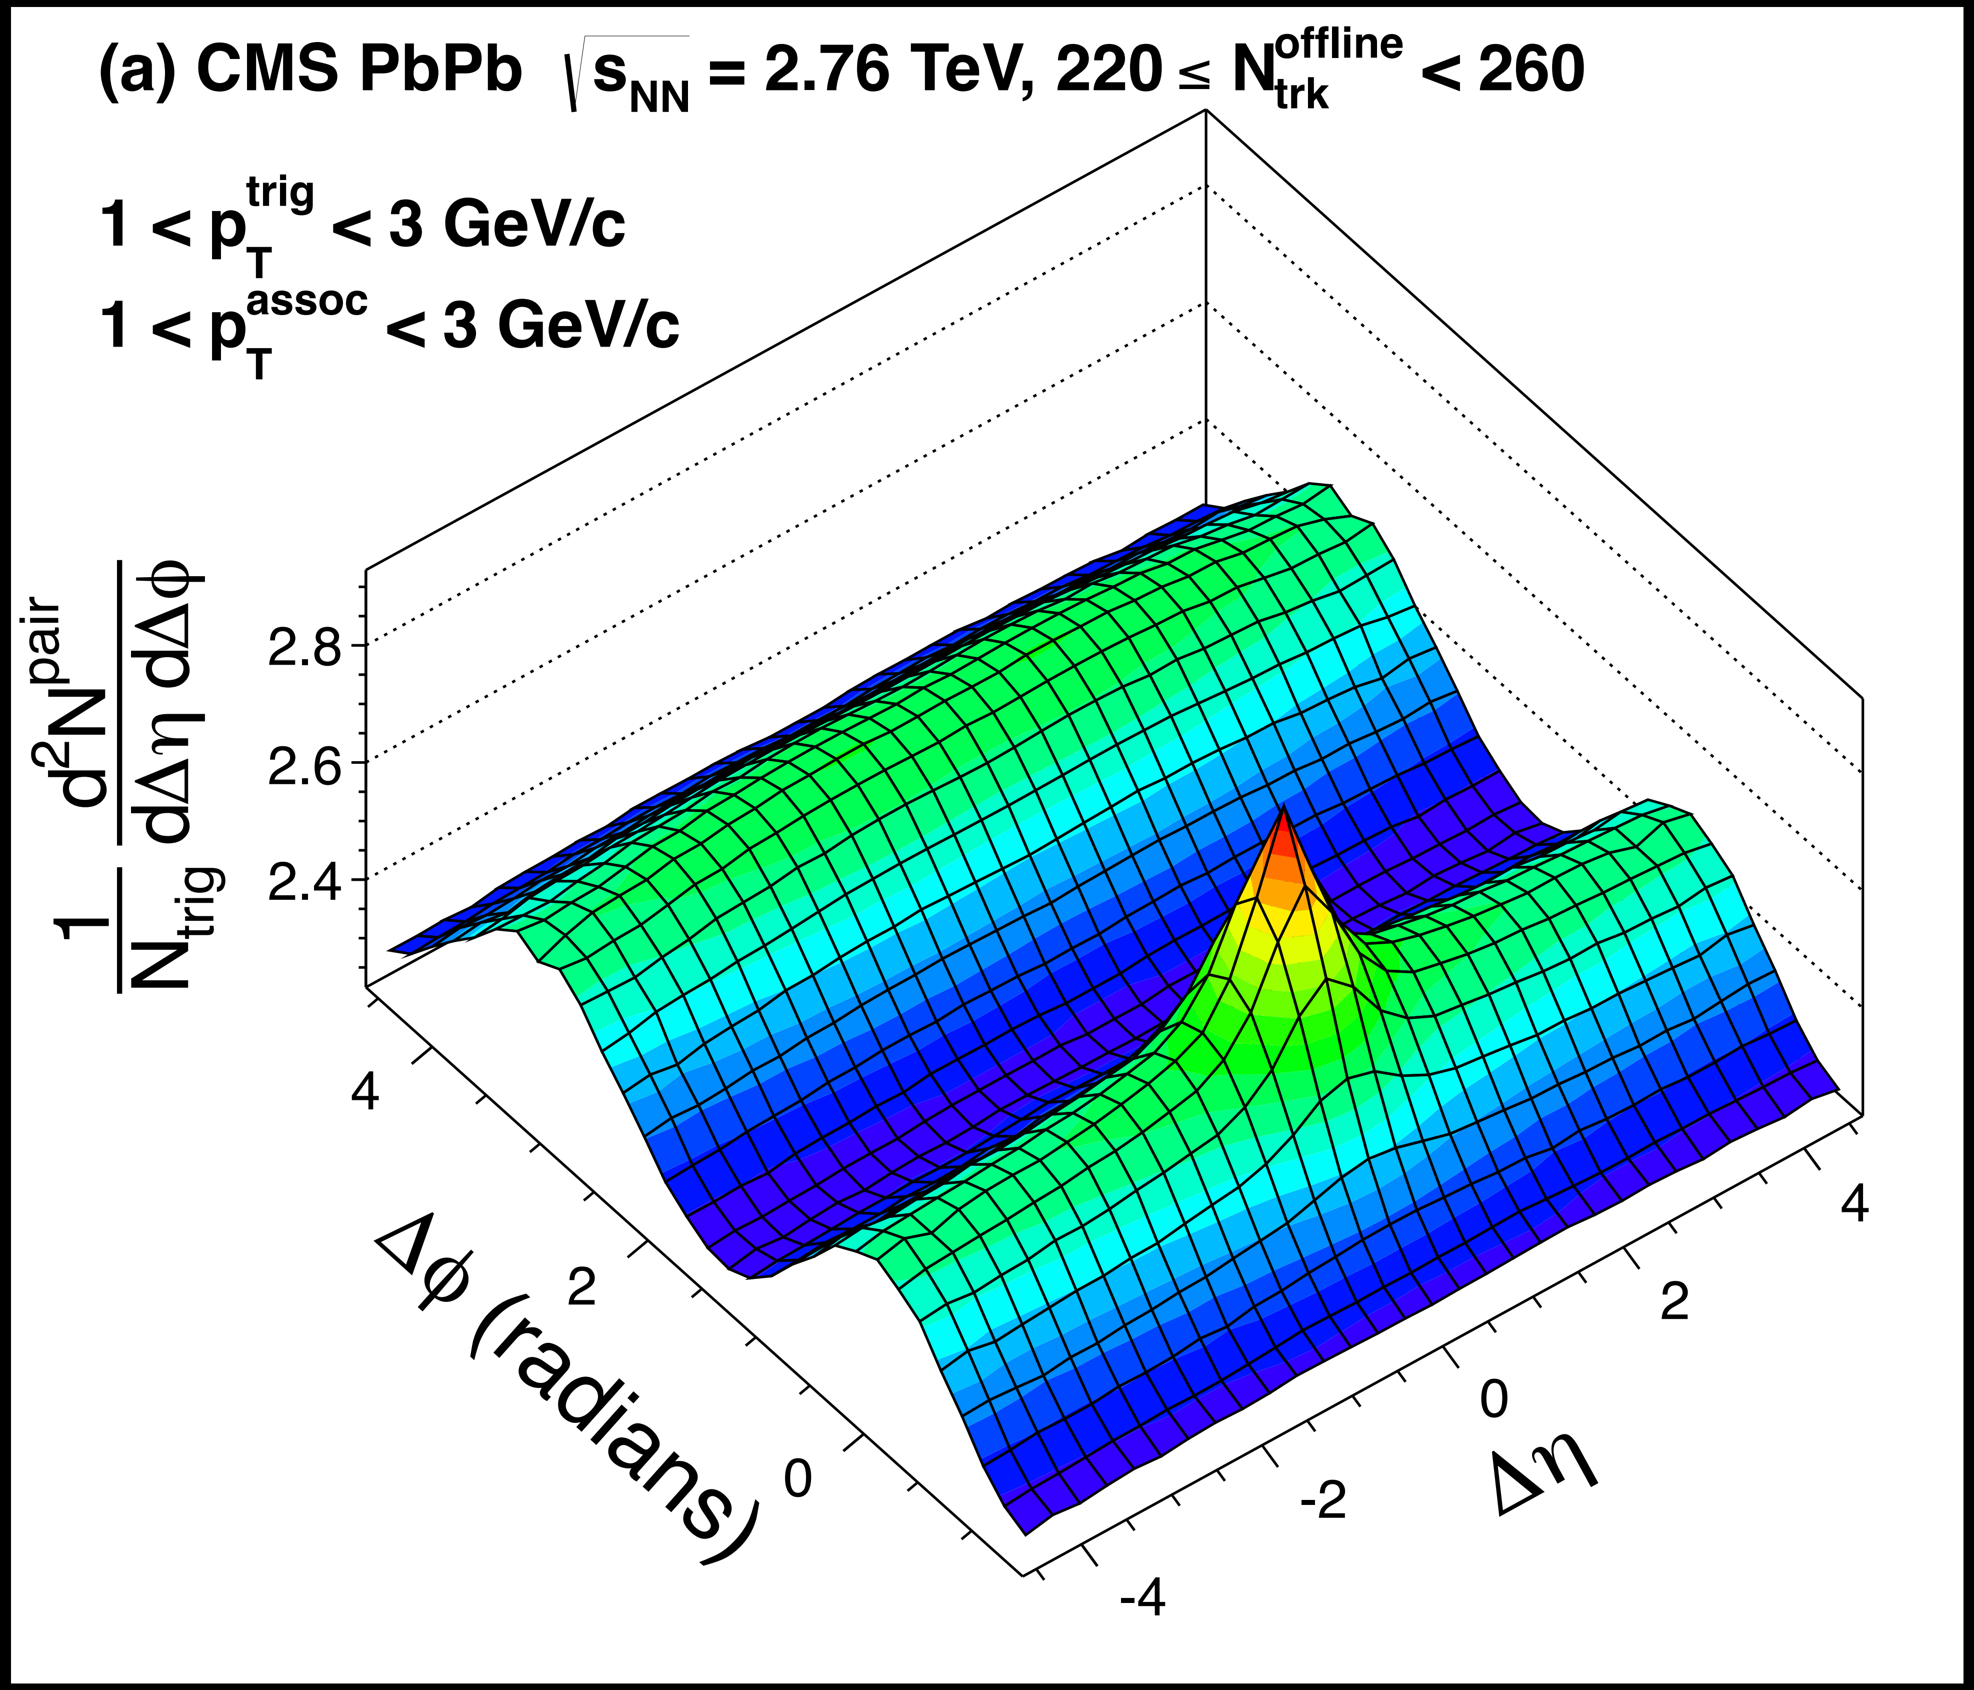


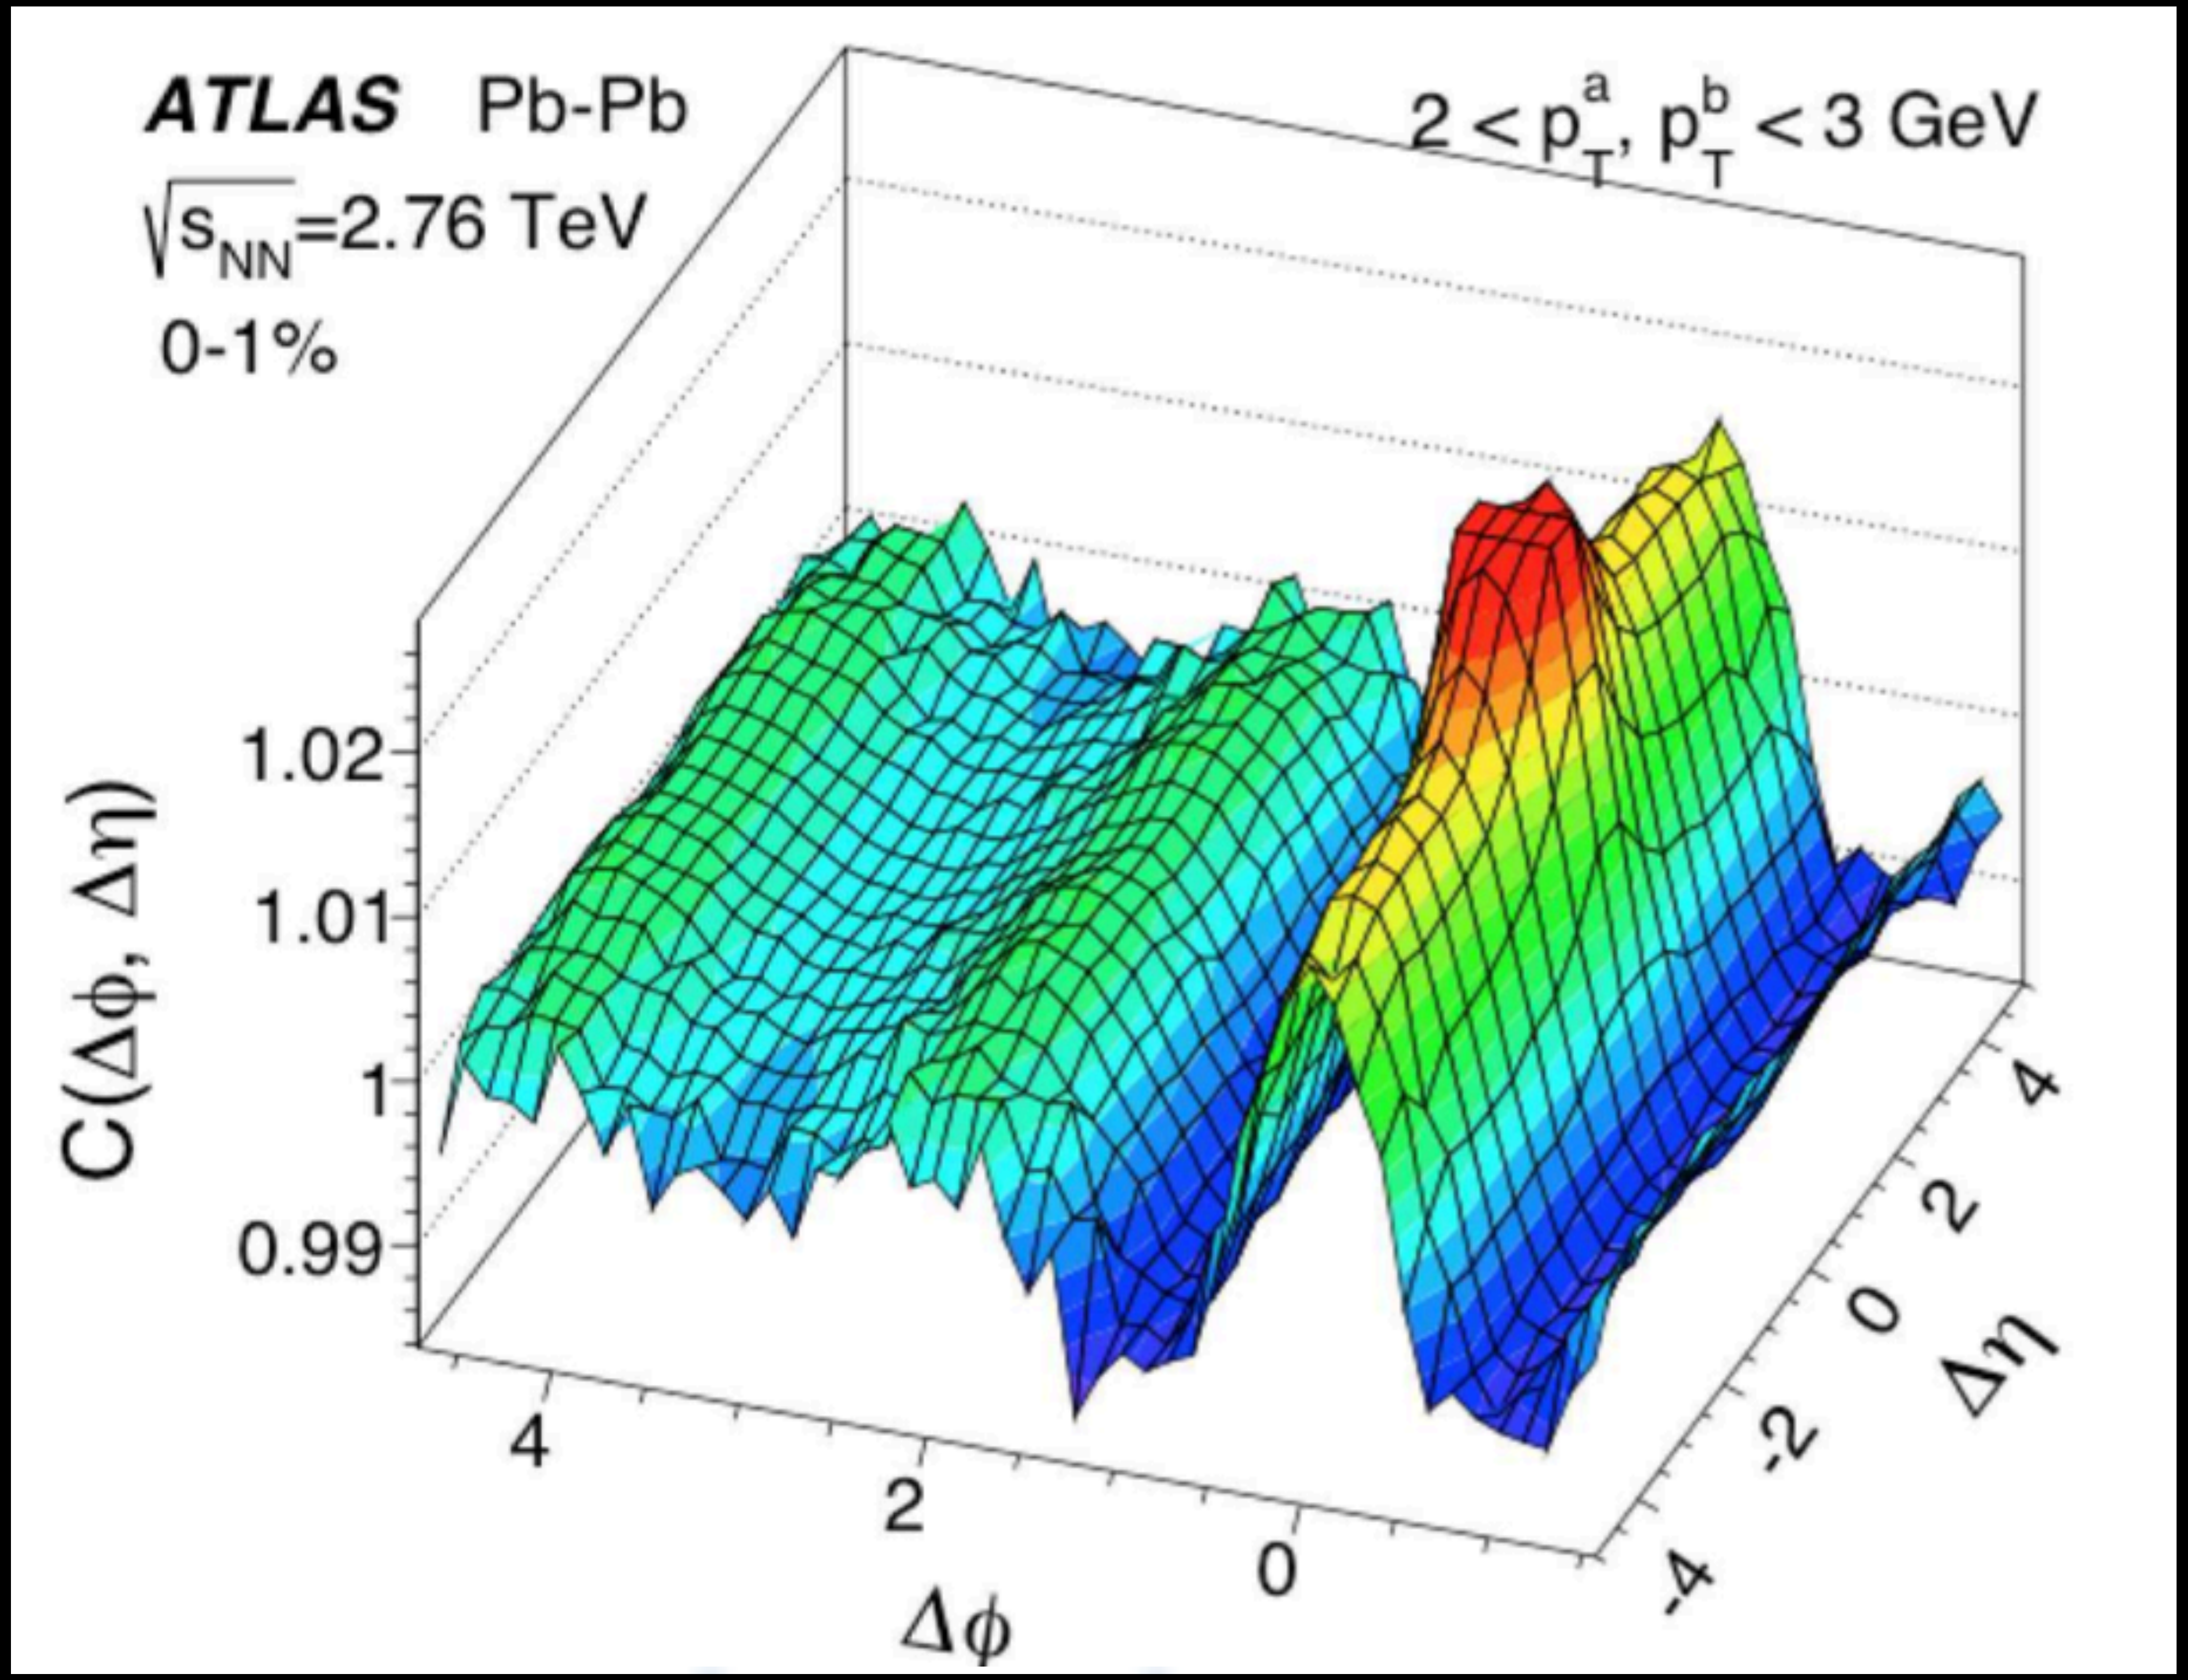




rotated to the planes of symmetry we clearly see
the different harmonics

Collective Flow

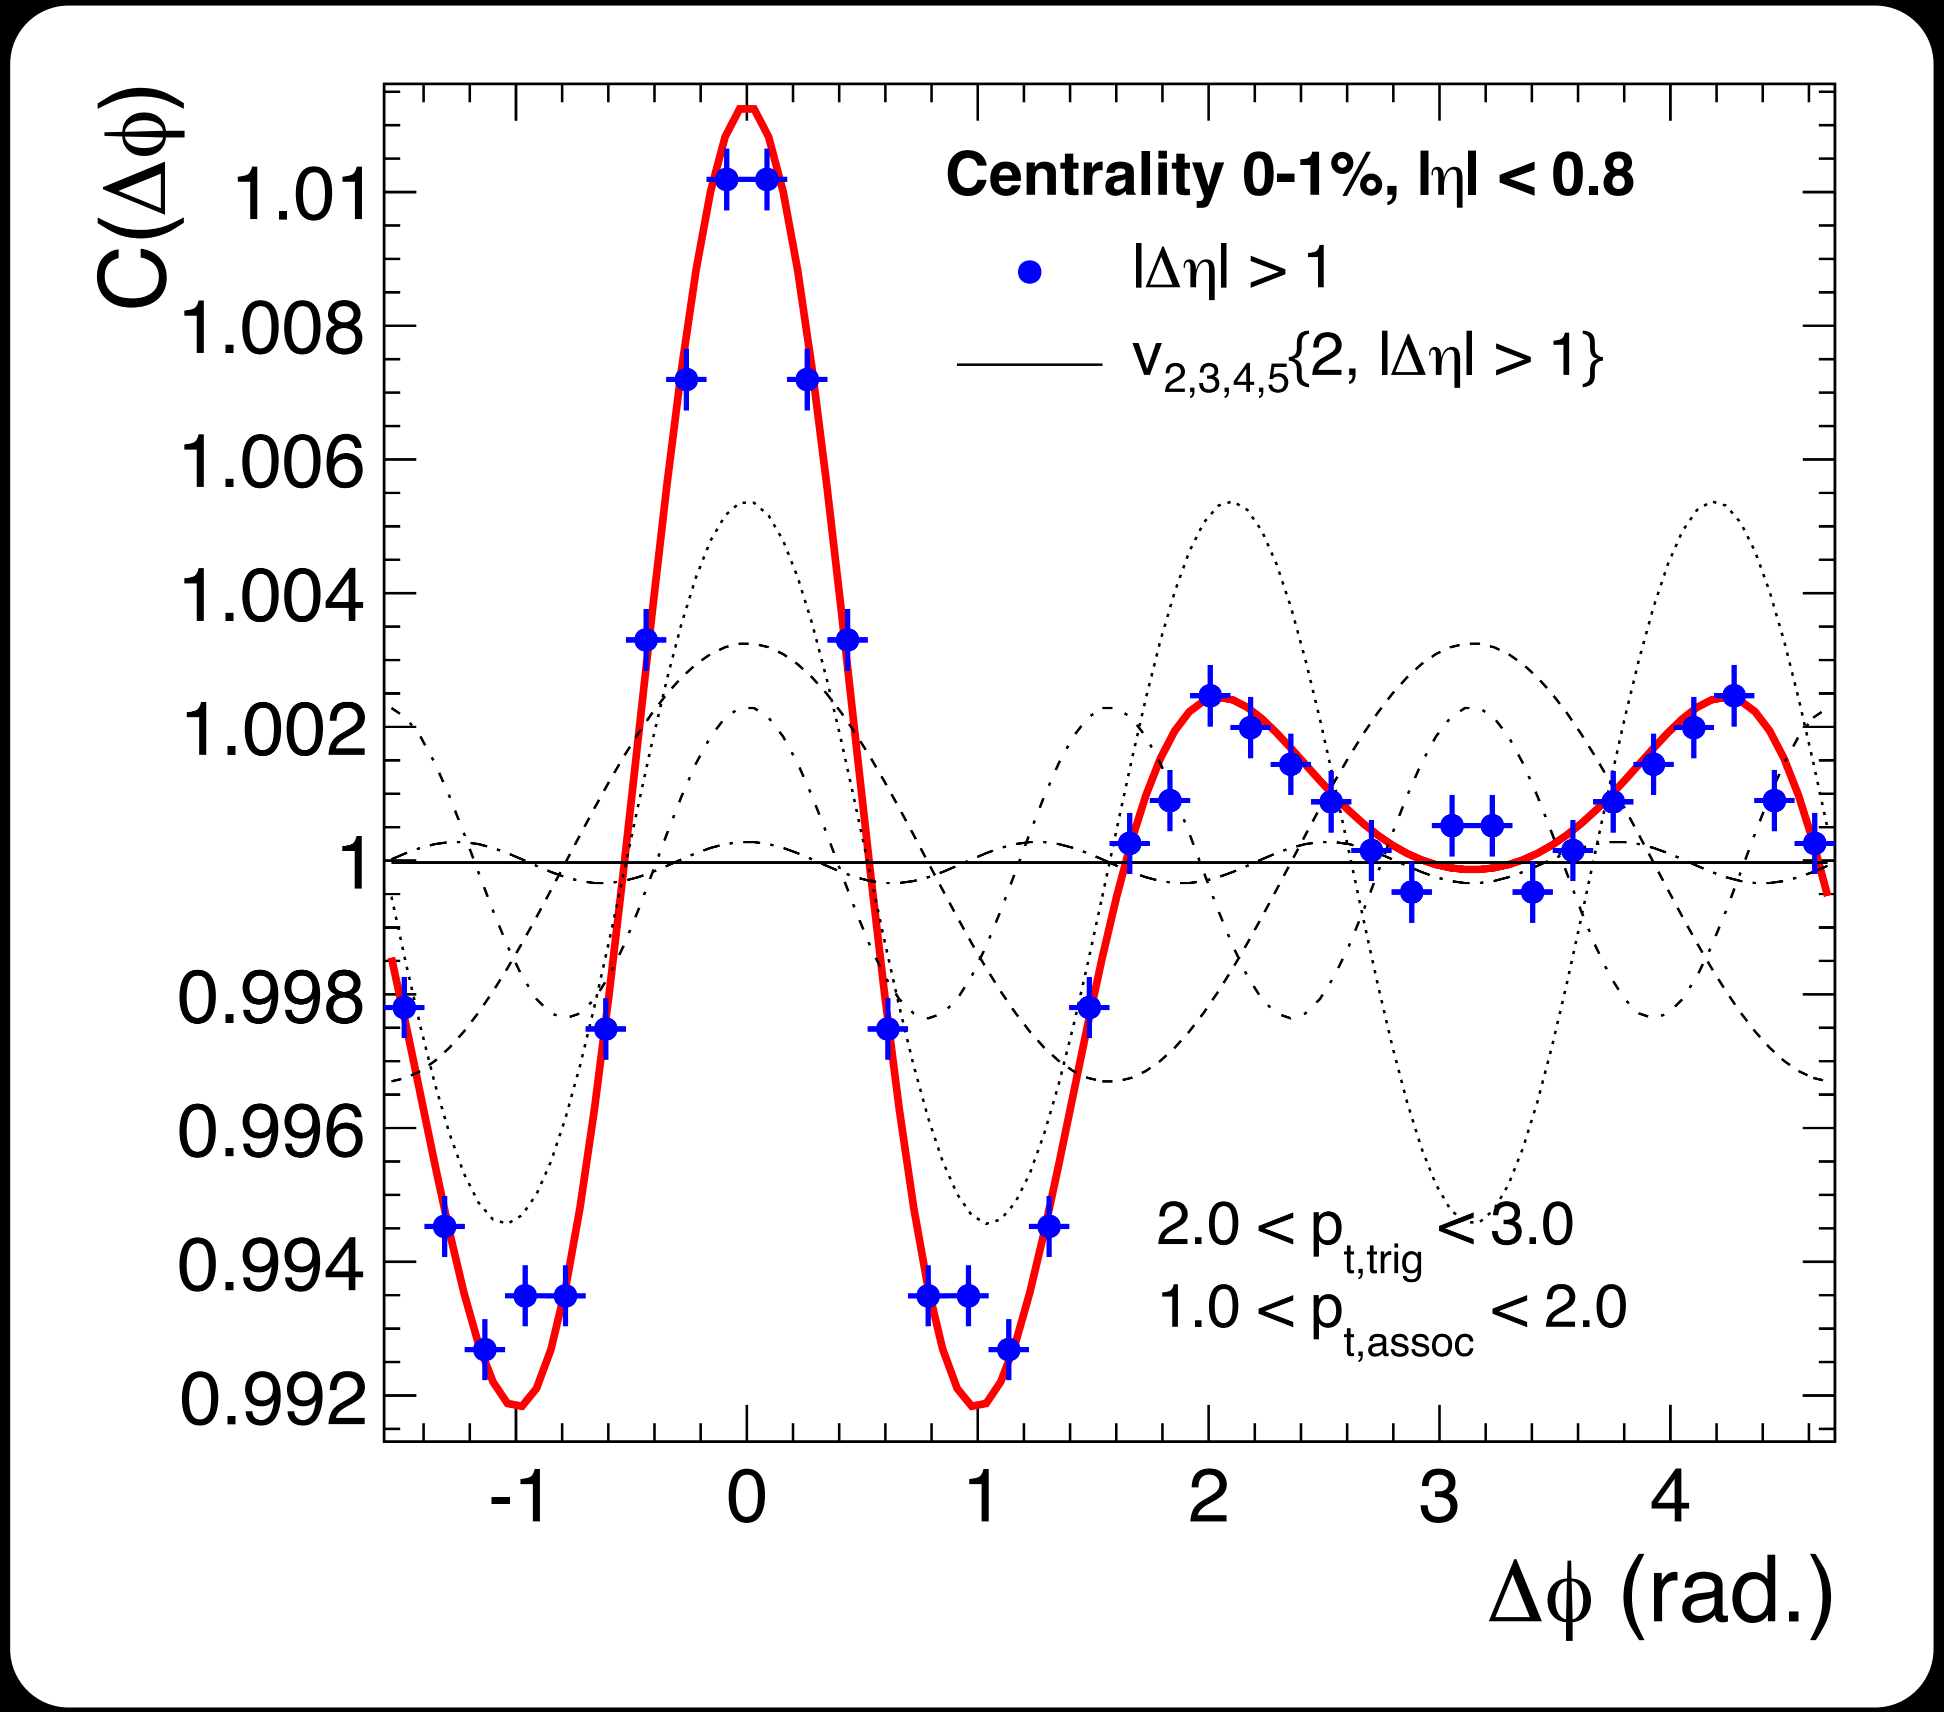




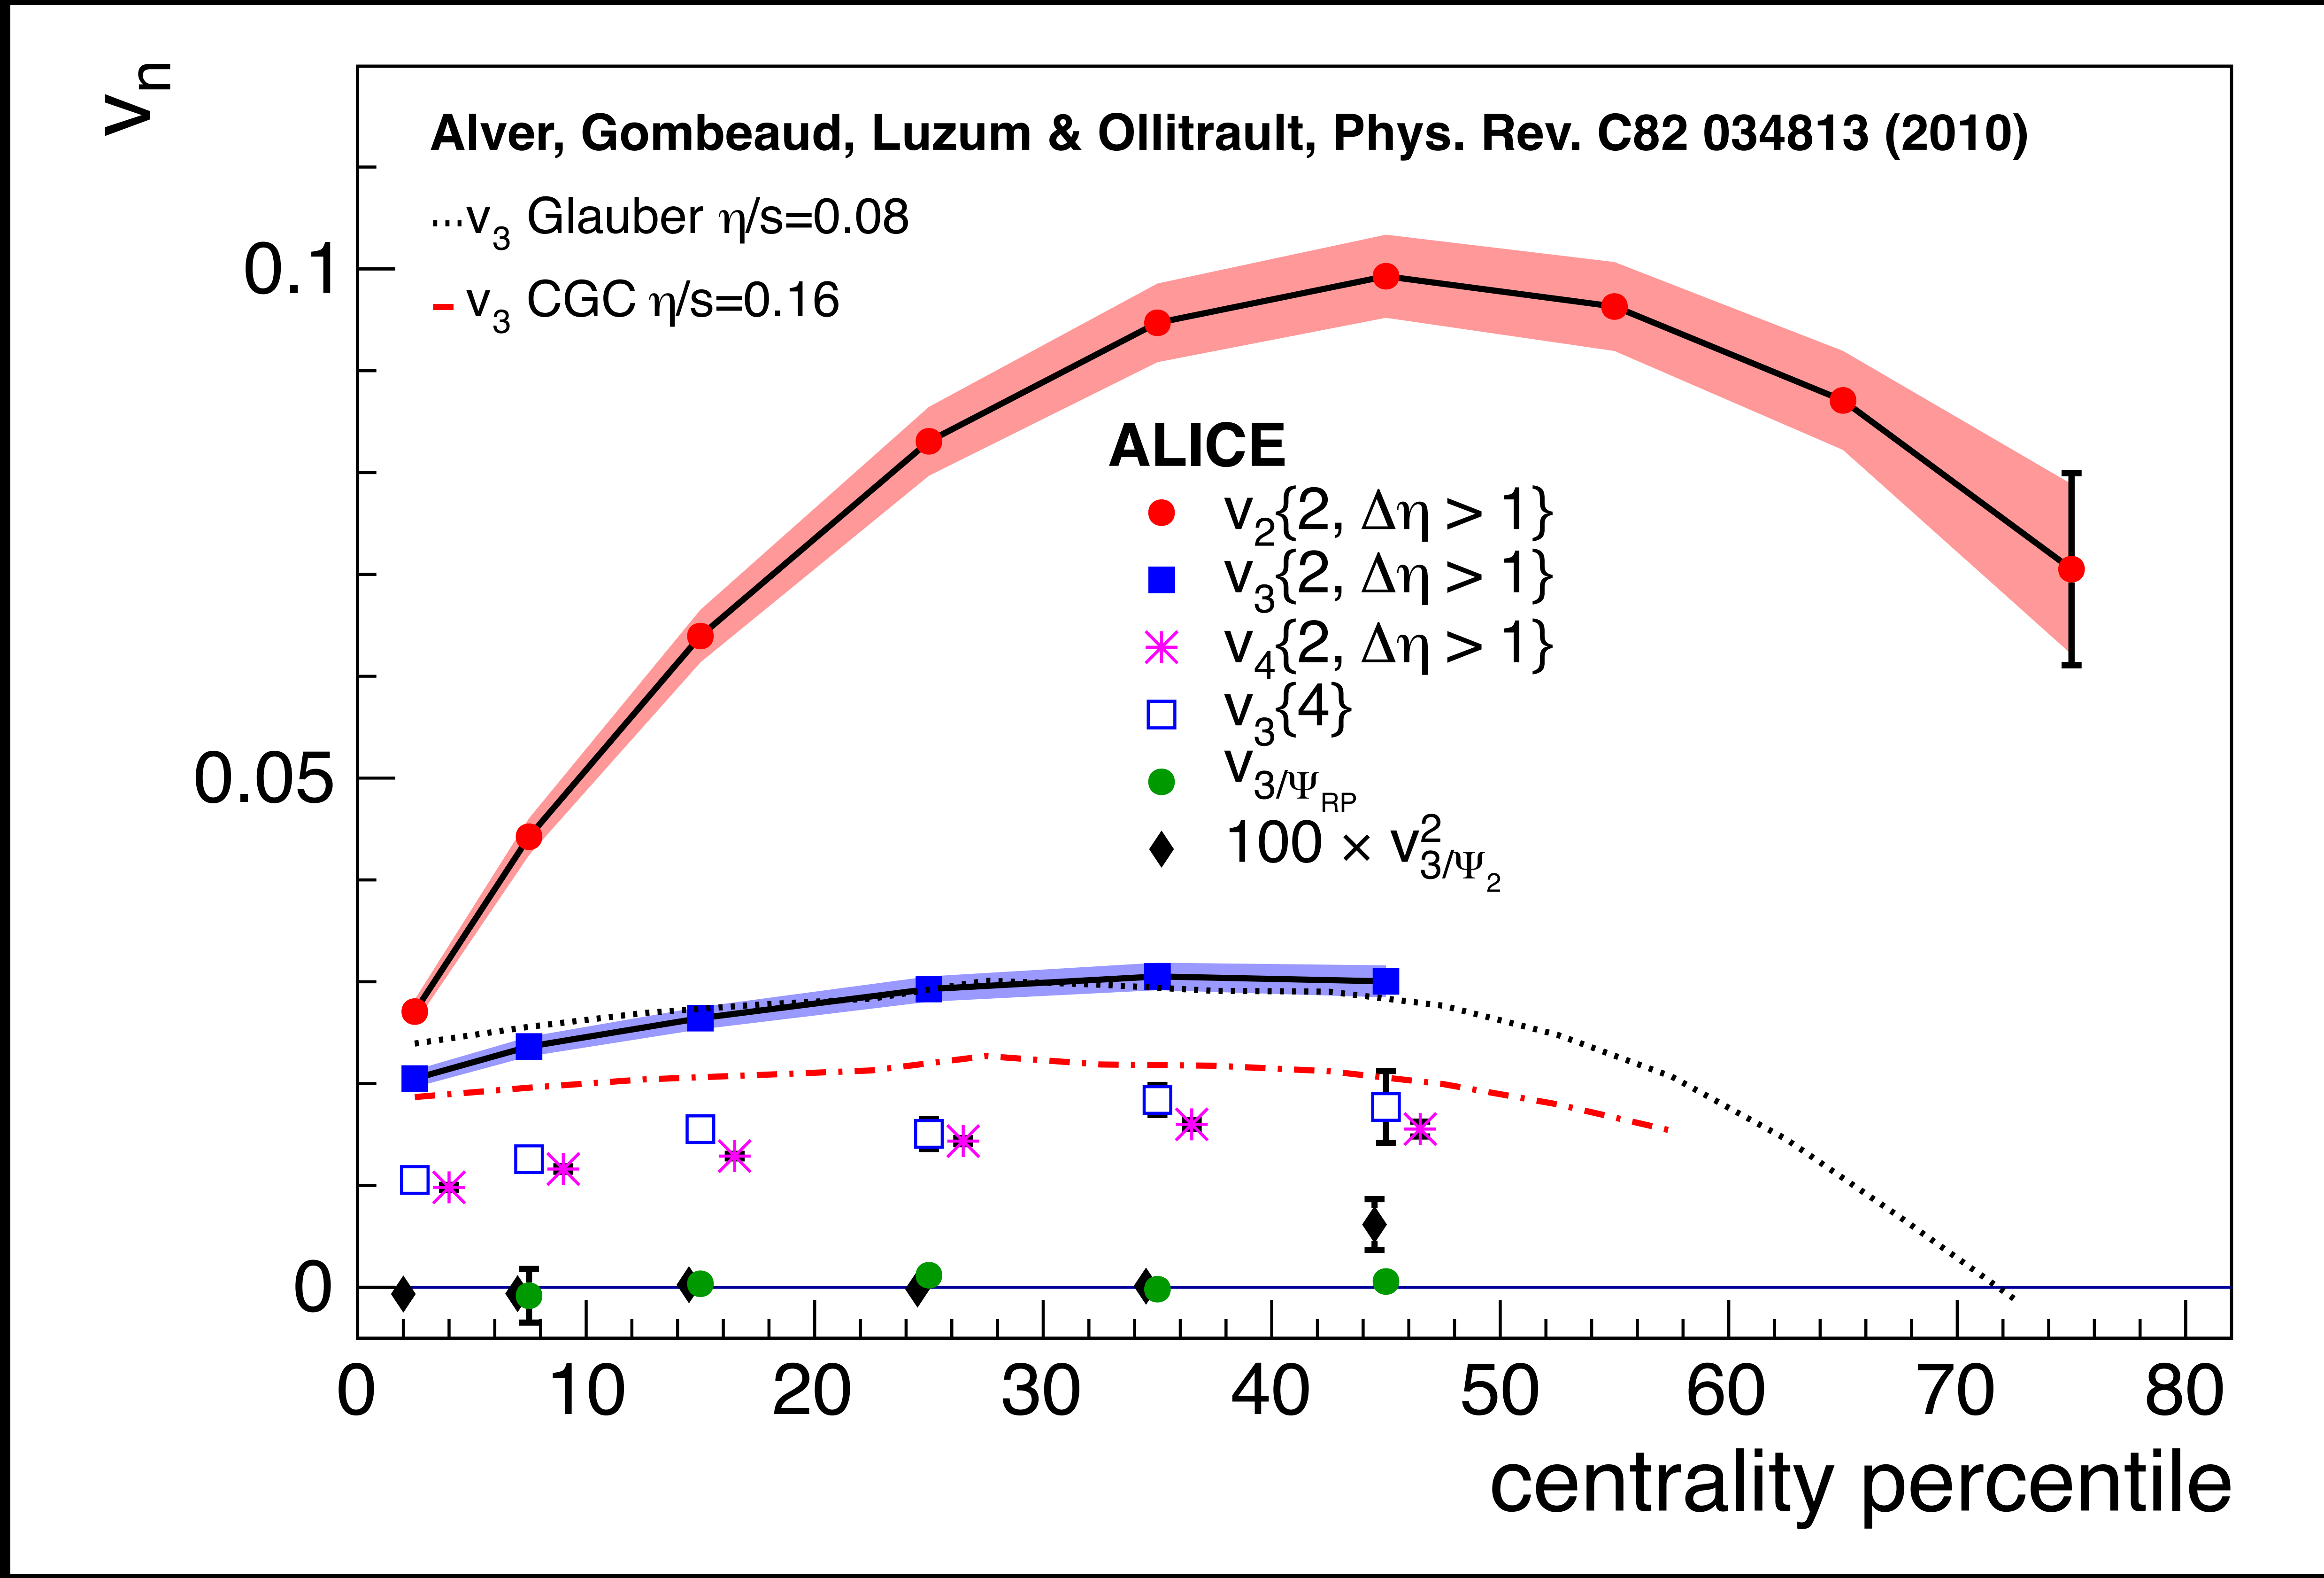
$$\frac{1}{N_{\rm trig}}\frac{\rm dN^{pair}}{\rm d\Delta\phi} = \frac{N_{\rm assoc}}{2\pi}[1+\sum_n 2V_{n\Delta}\cos(n\Delta\phi)]$$

Collective Flow

ALICE arXiv:1105.3865 (2011)



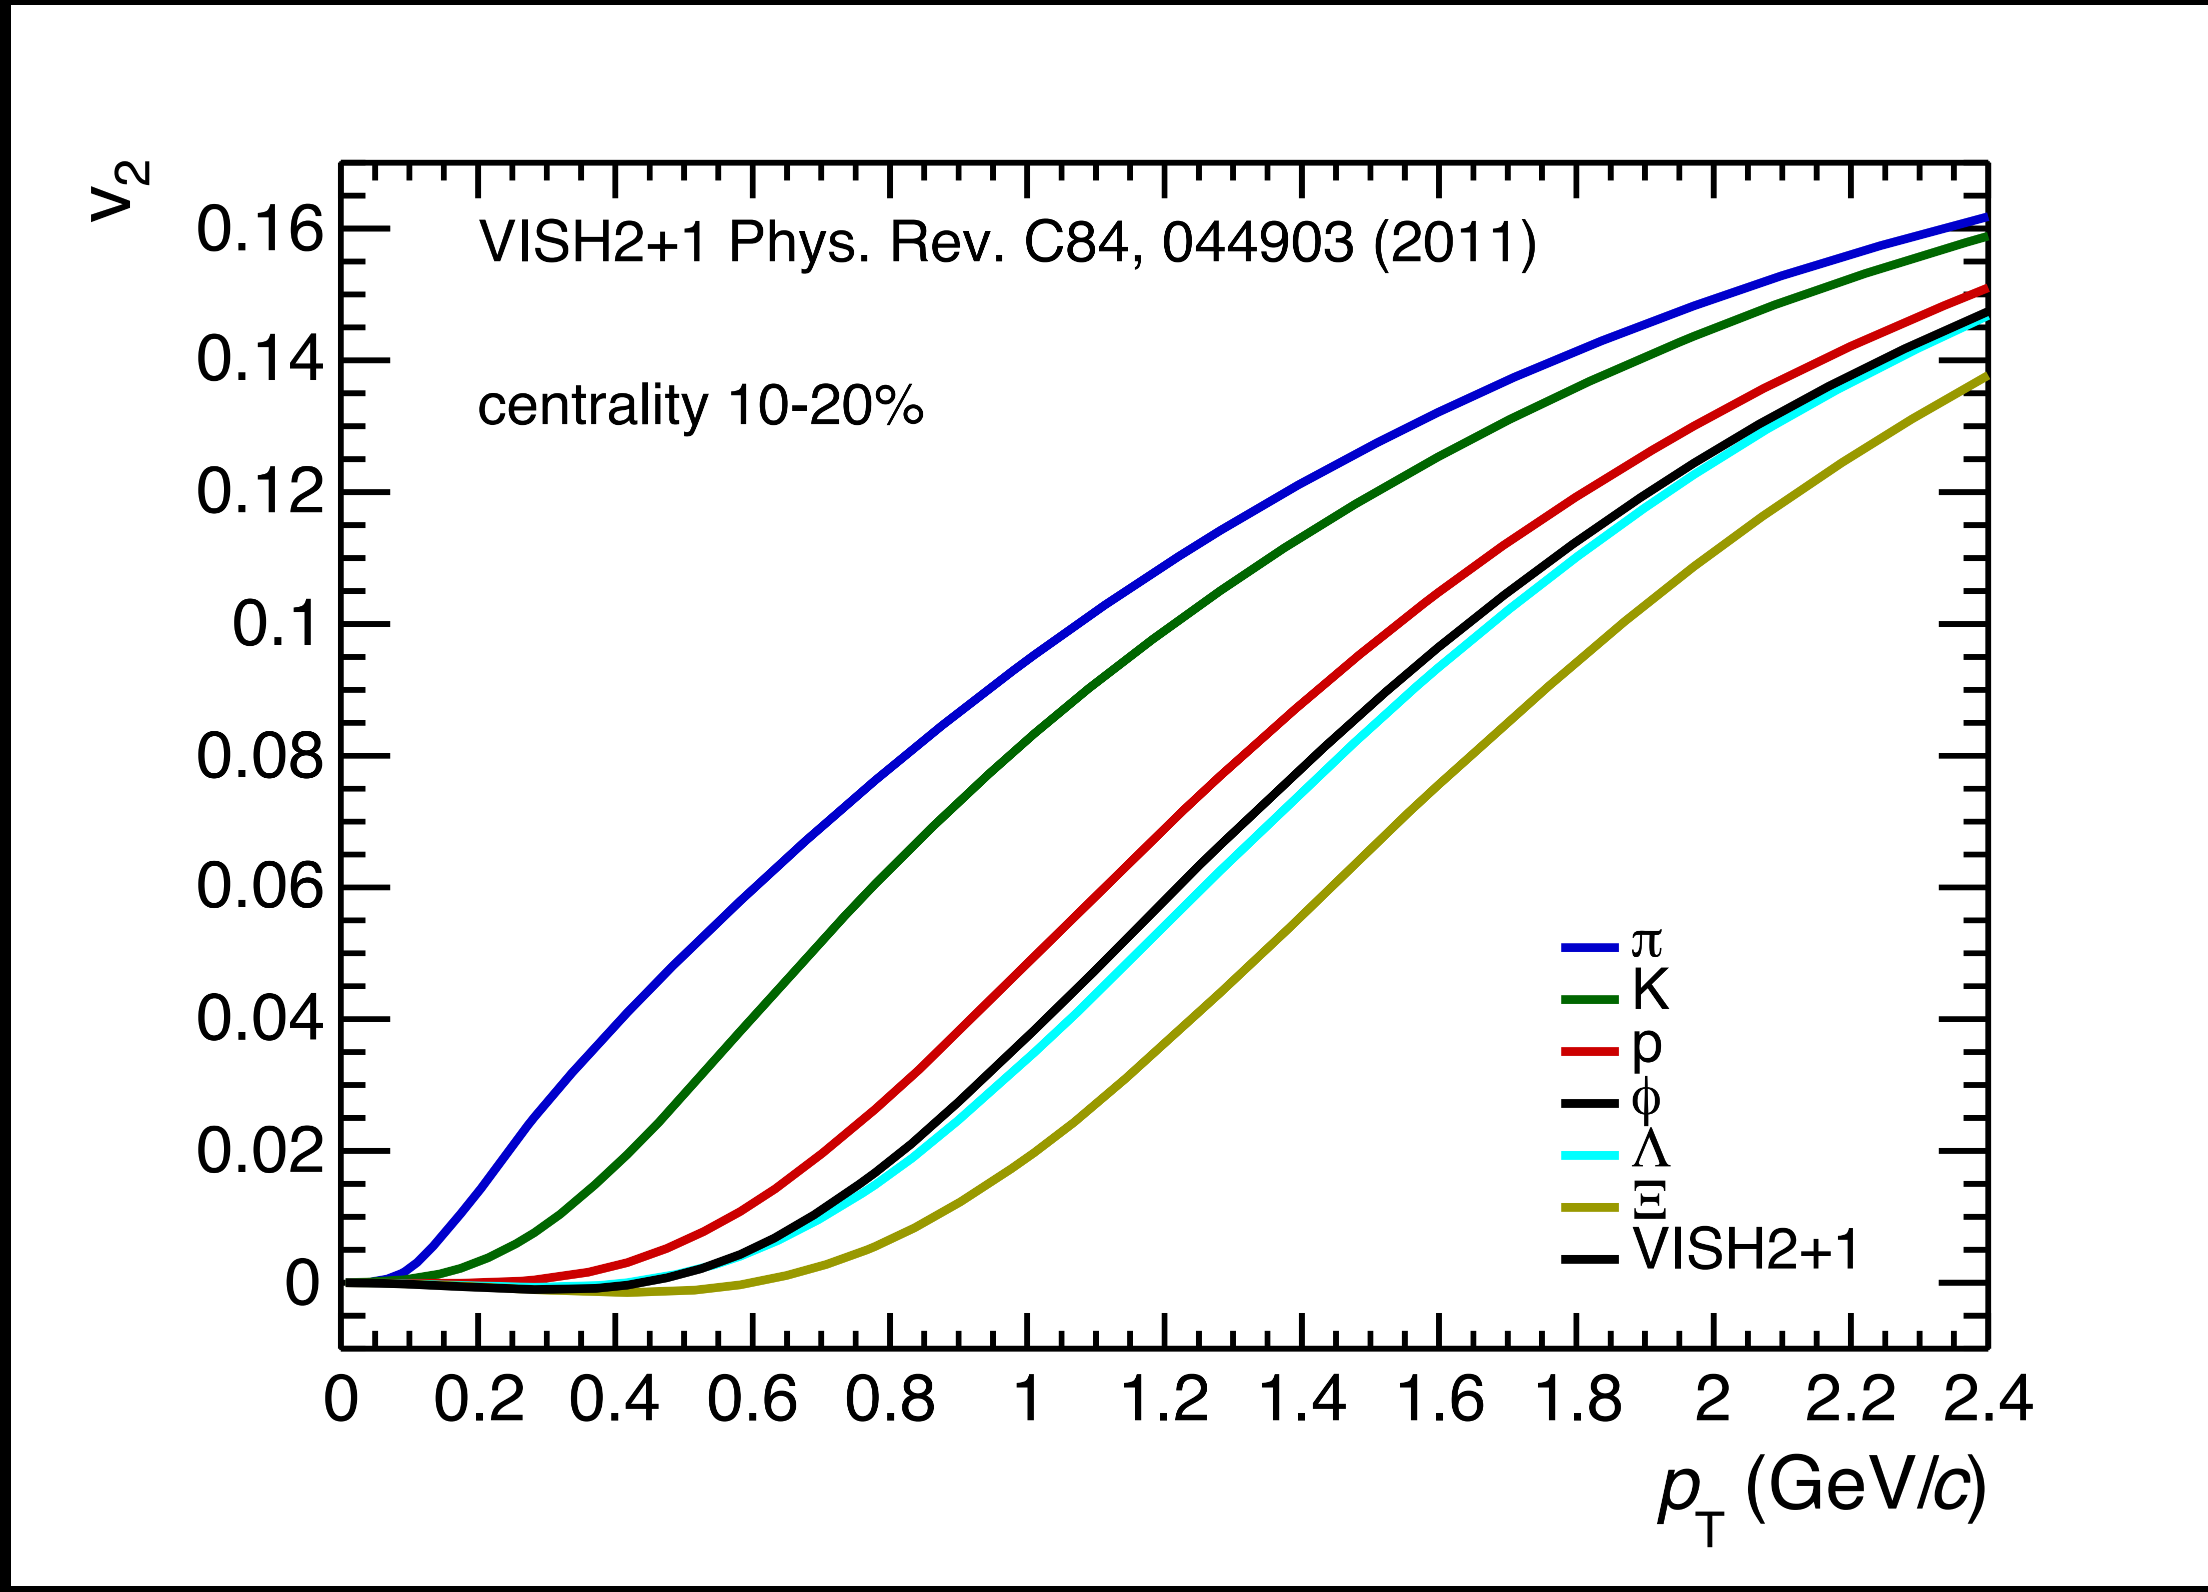
ALICE arXiv:1105.3865 (2011)

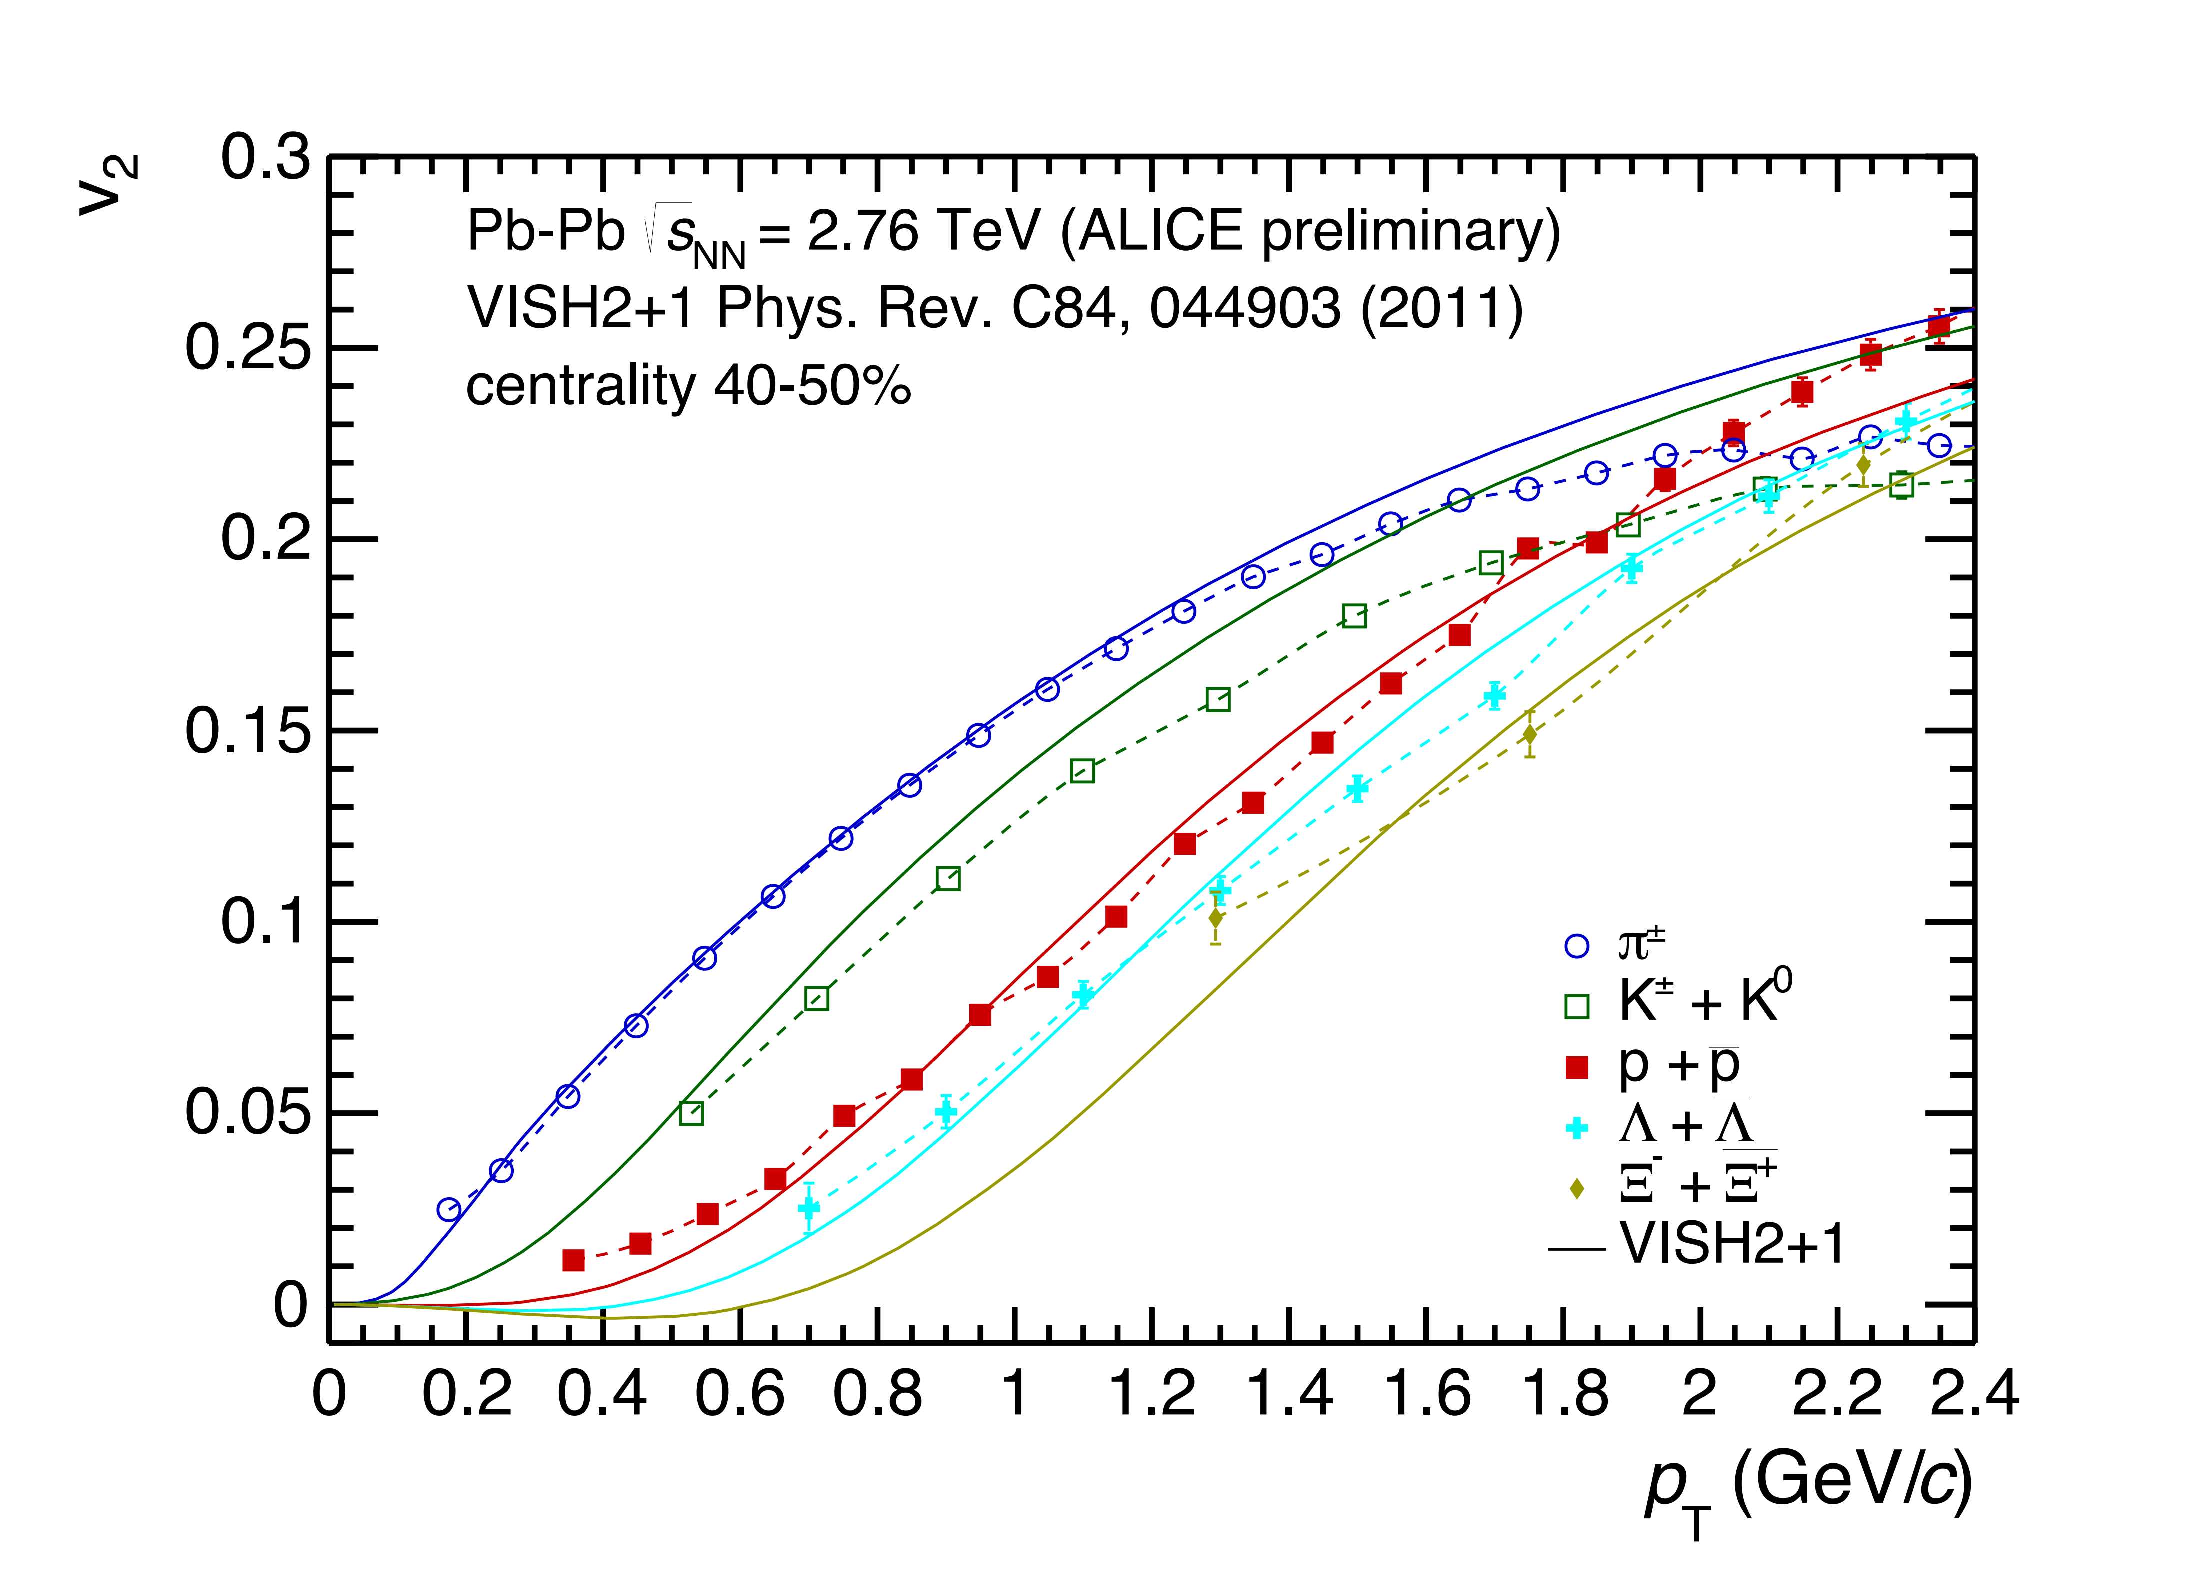


$$\frac{1}{N_{\rm trig}}\frac{{\rm dN}^{\rm pair}}{{\rm d}\Delta\phi} = \frac{N_{\rm assoc}}{2\pi}[1 + \sum_n 2V_{n\Delta}\cos(n\Delta\phi)]$$

Described very well in a viscous hydrodynamic framework

Collective Flow



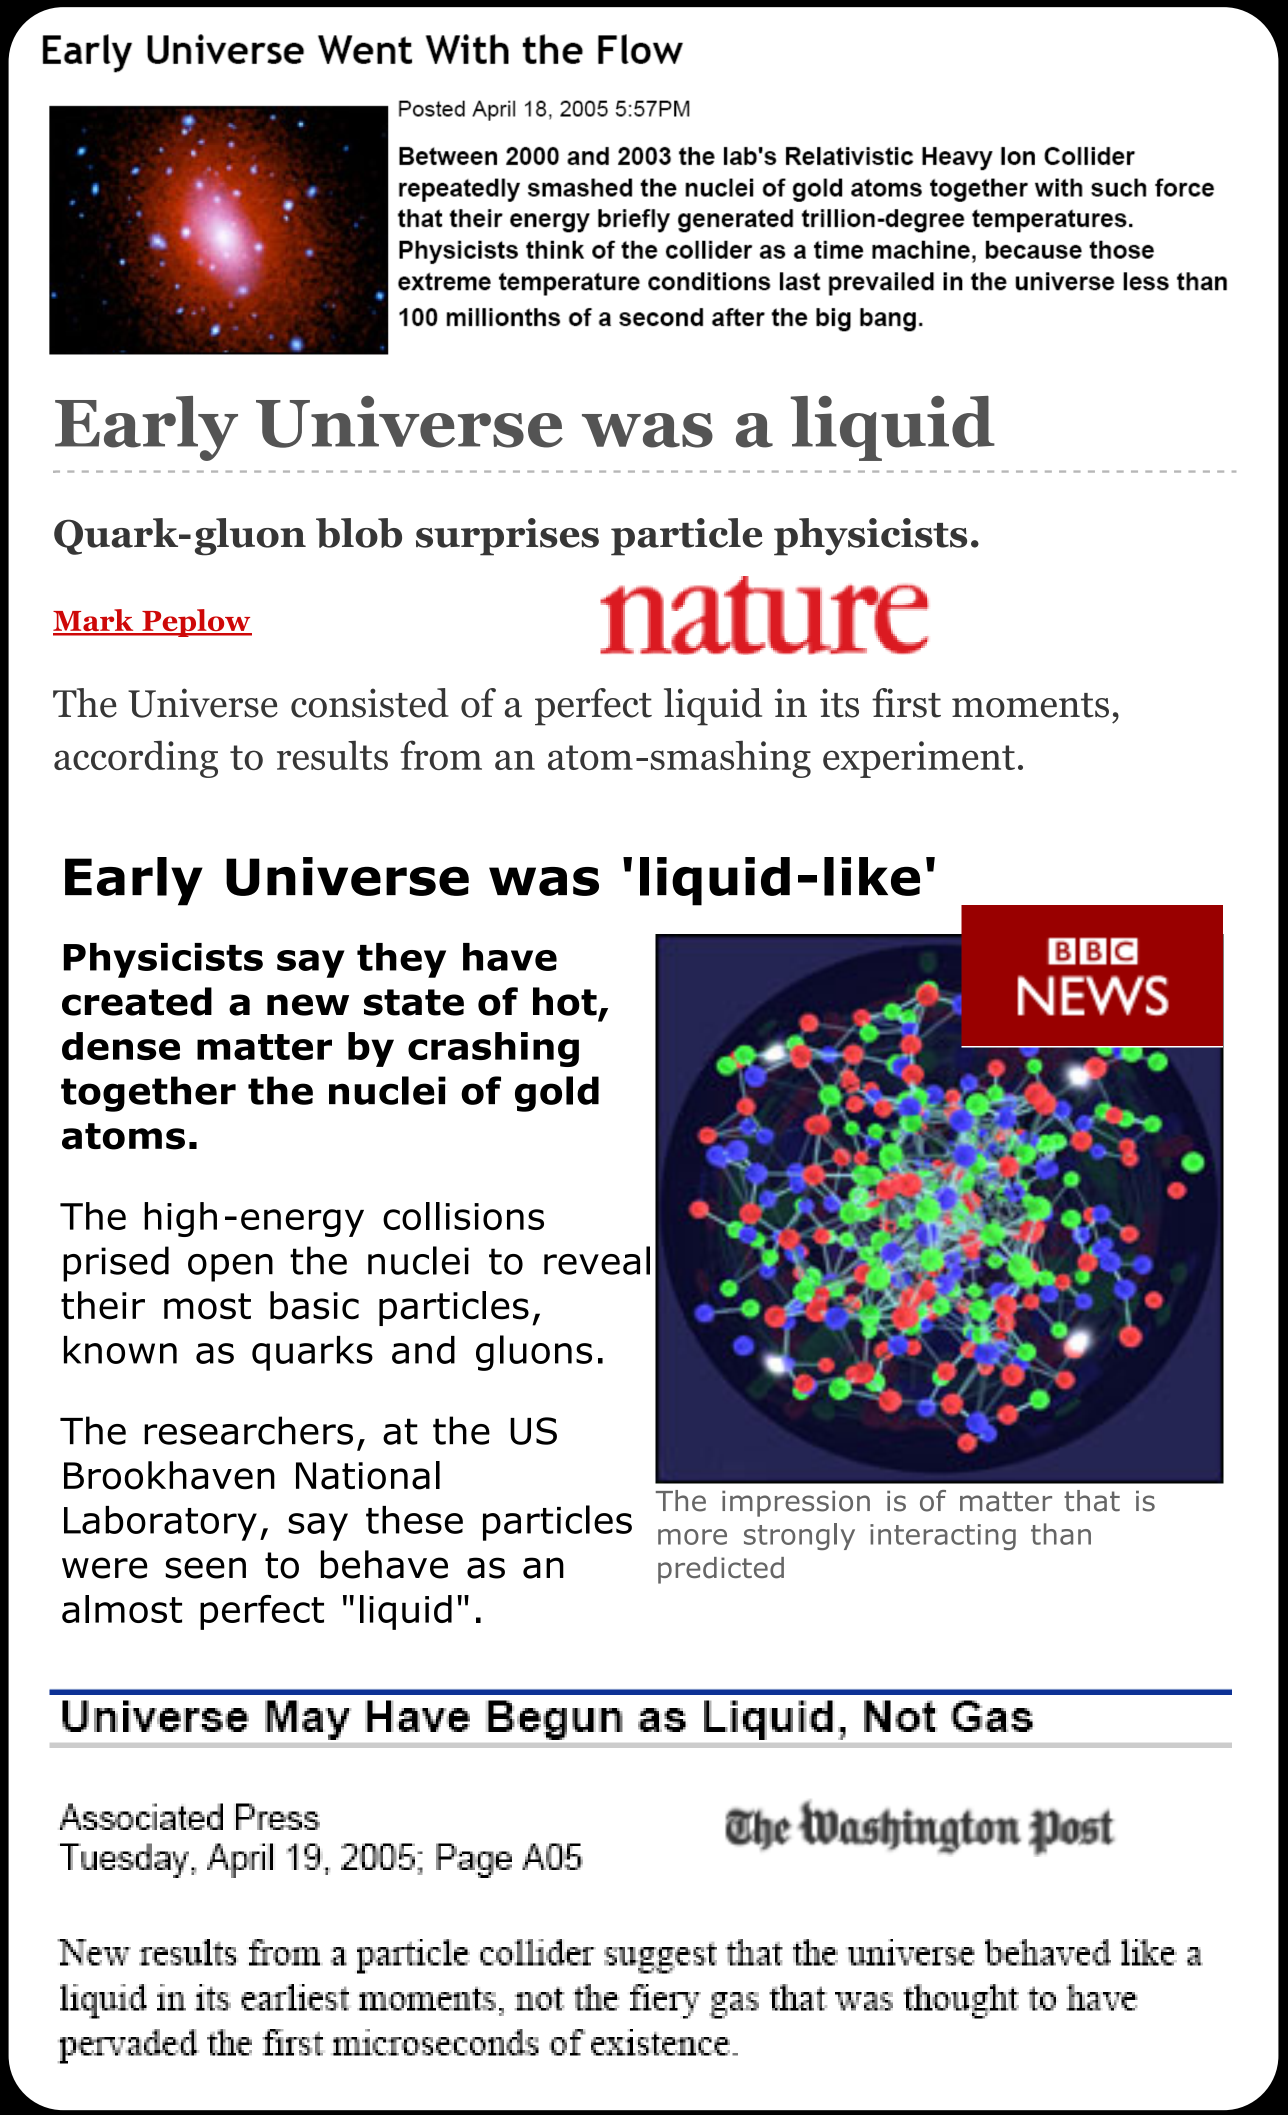


ALICE arXiv:1405.4632

$$\frac{1}{N_{\mathrm{trig}}}\frac{\mathrm{dN}^{\mathrm{pair}}}{\mathrm{d}\Delta\phi} = \frac{N_{\mathrm{assoc}}}{2\pi}[1+\sum_{n} 2V_{n\Delta}\cos(n\Delta\phi)]$$

Described very well in a viscous hydrodynamic framework

Our current understanding



Early Universe Went With the Flow

Posted April 18, 2005 5:57PM

Between 2000 and 2003 the lab's Relativistic Heavy Ion Collider repeatedly smashed the nuclei of gold atoms together with such force that their energy briefly generated trillion-degree temperatures. Physicists think of the collider as a time machine, because those extreme temperature conditions last prevailed in the universe less than 100 millionths of a second after the big bang.

Early Universe was a liquid

Quark-gluon blob surprises particle physicists.

Mark Peplow

nature

The Universe consisted of a perfect liquid in its first moments, according to results from an atom-smashing experiment.

Early Universe was 'liquid-like'

BBC NEWS

Physicists say they have created a new state of hot, dense matter by crashing together the nuclei of gold atoms.

The high-energy collisions prised open the nuclei to reveal their most basic particles, known as quarks and gluons.

The researchers, at the US Brookhaven National Laboratory, say these particles were seen to behave as an almost perfect "liquid".

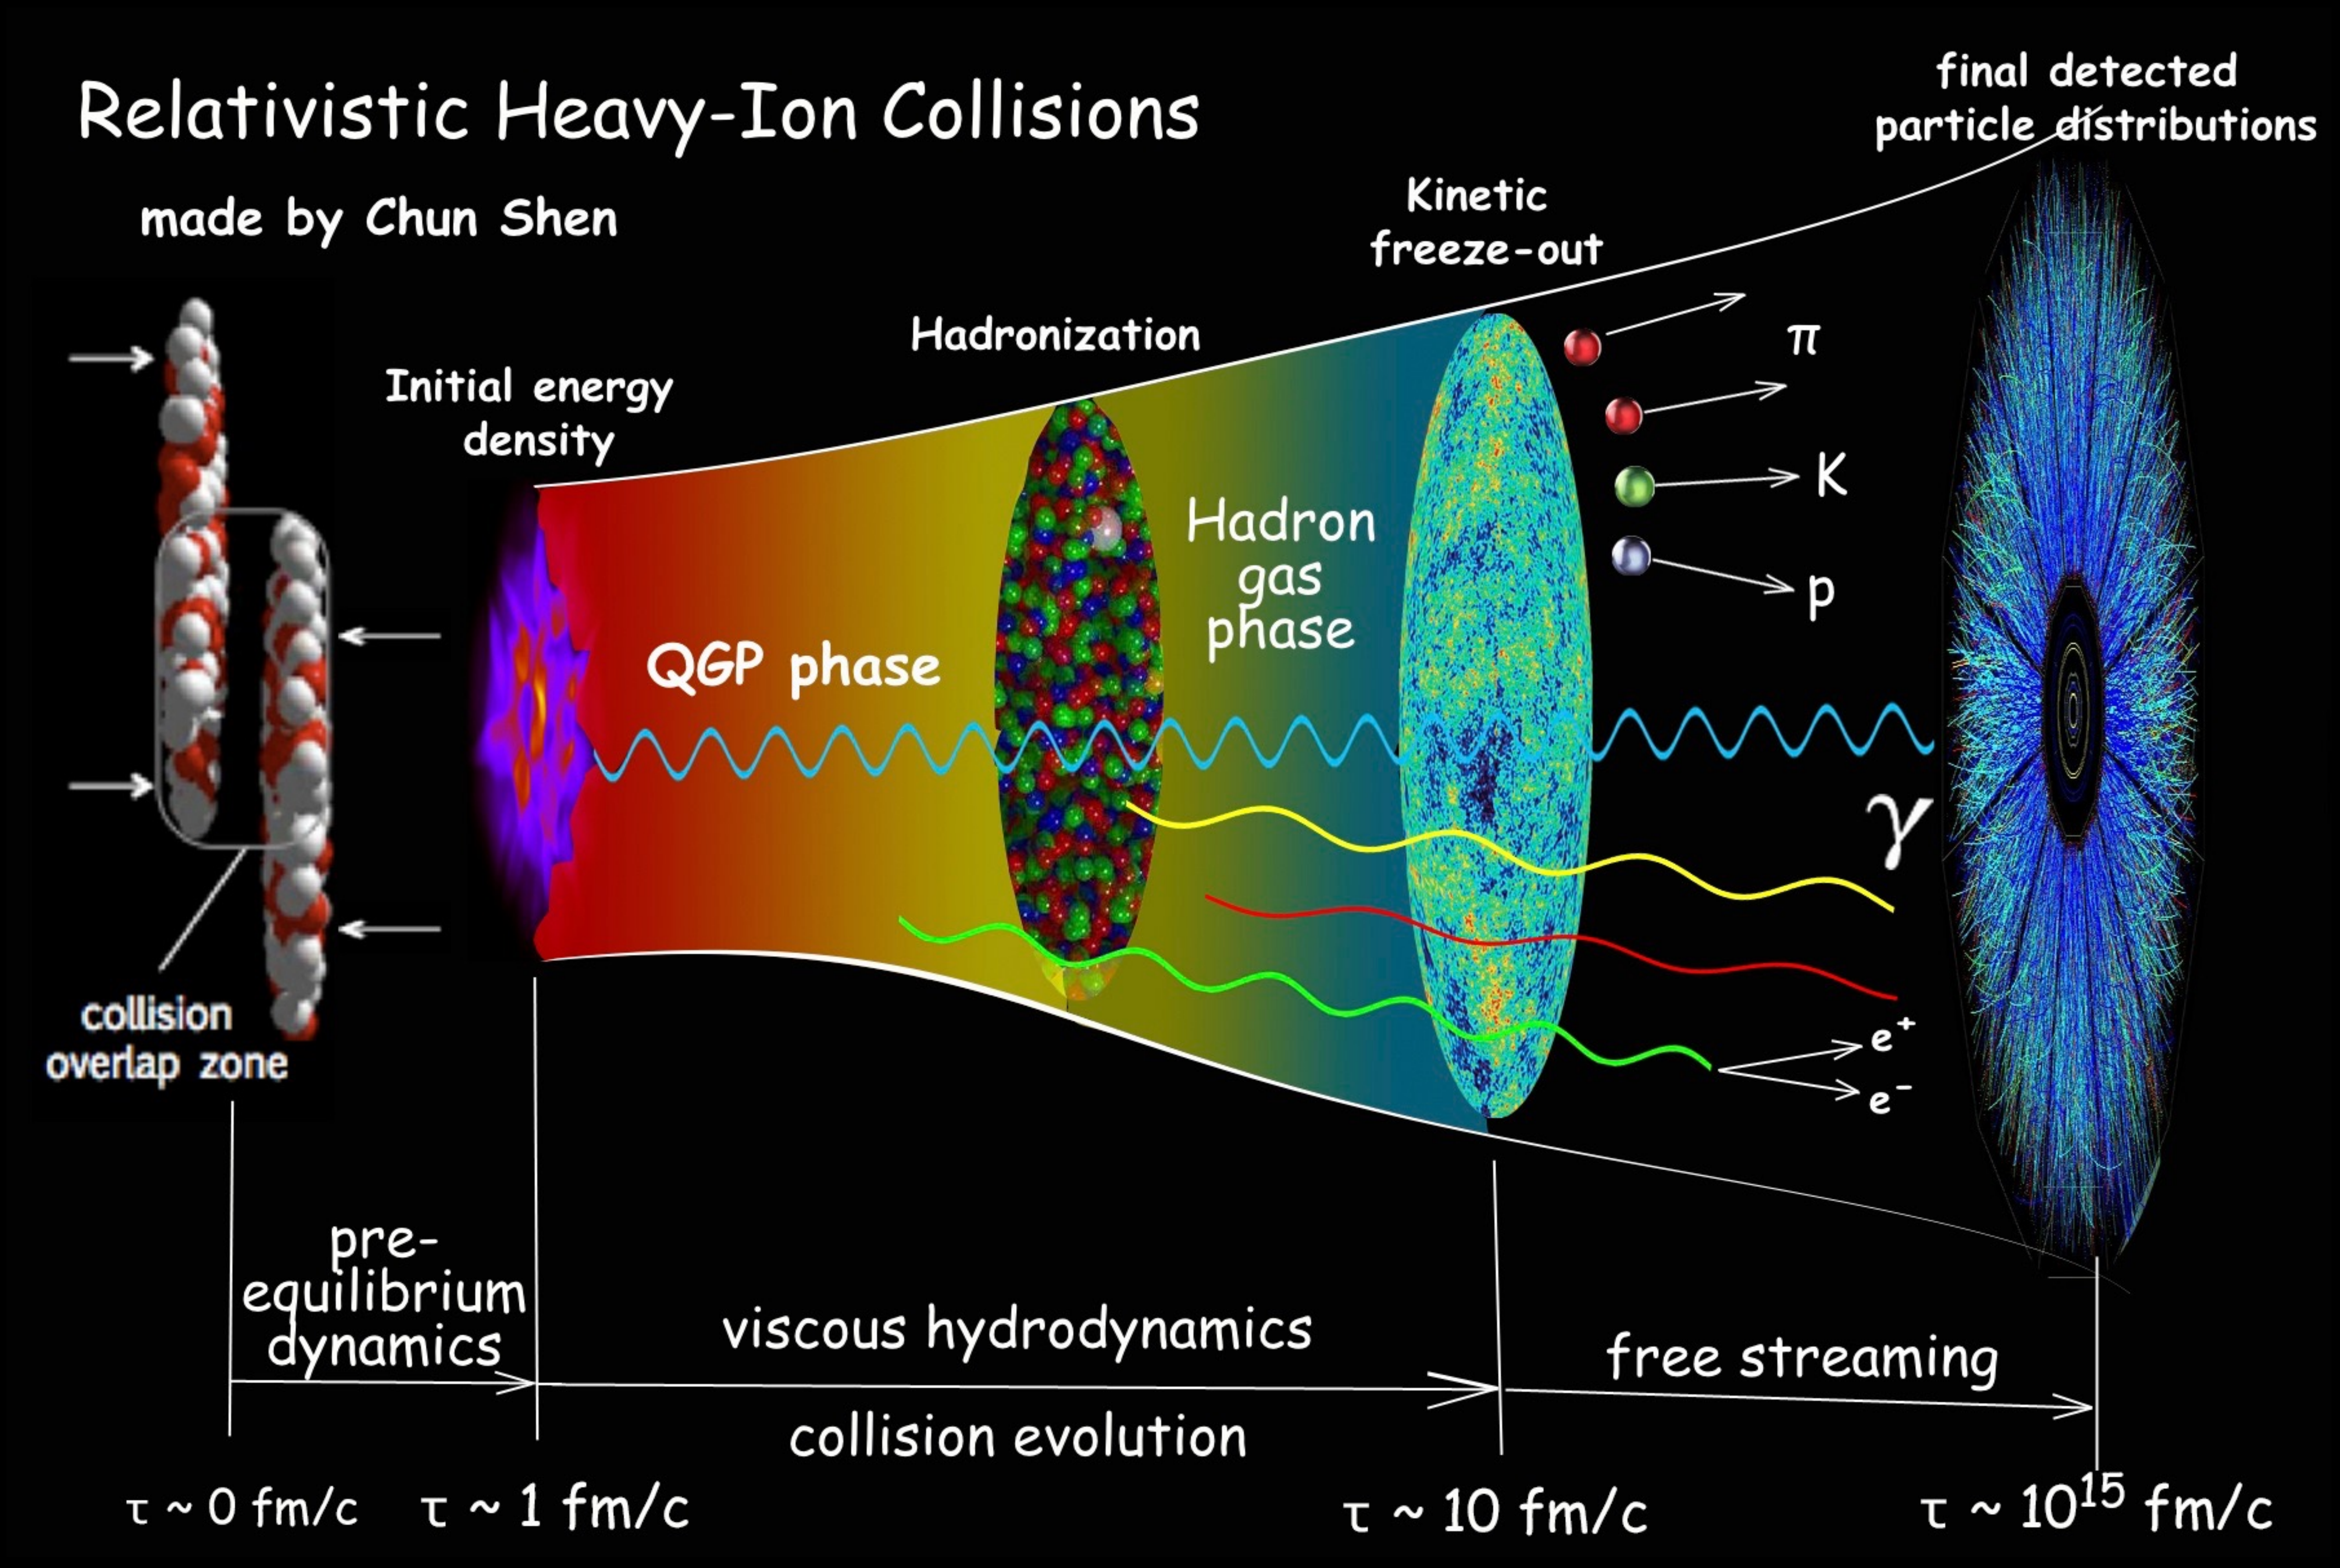
The impression is of matter that is more strongly interacting than predicted

Universe May Have Begun as Liquid, Not Gas

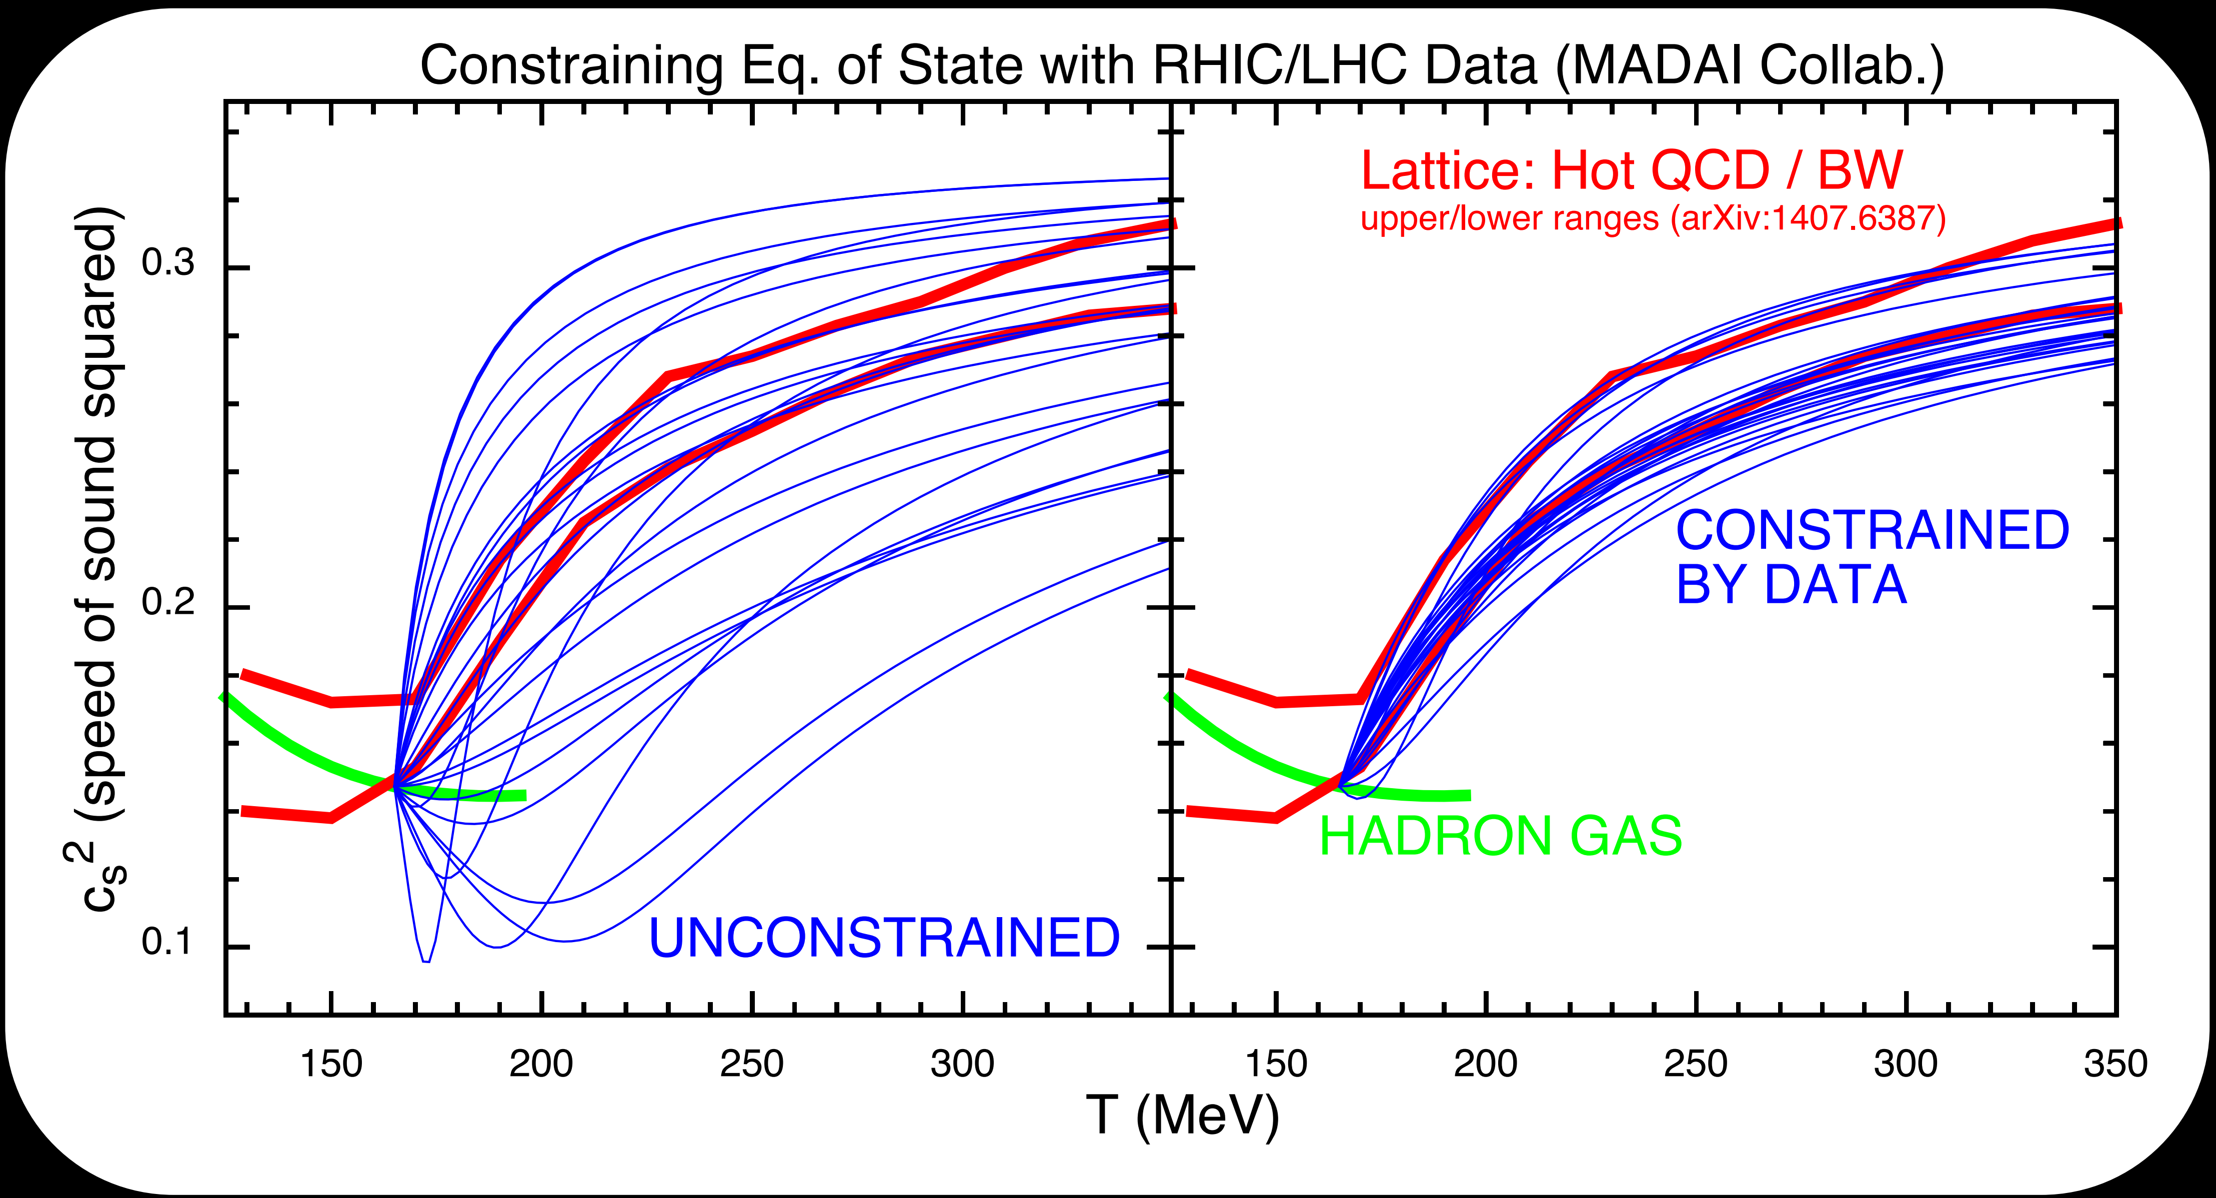
Associated Press
Tuesday, April 19, 2005; Page A05

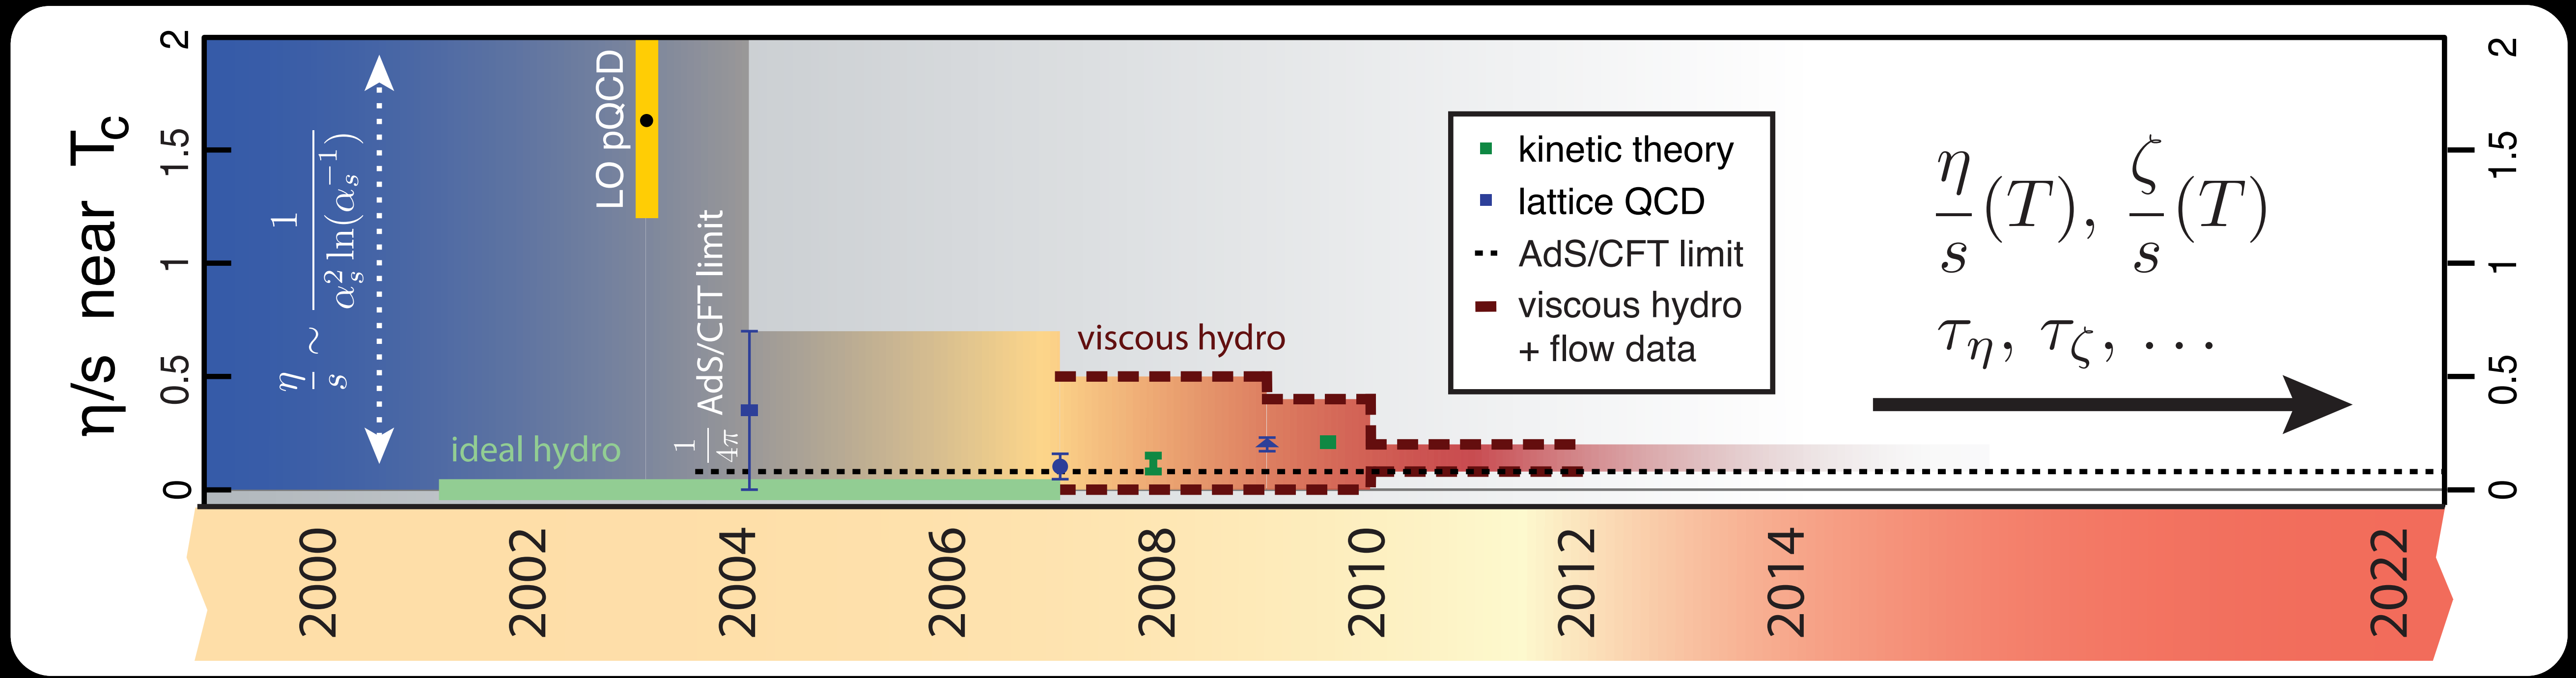
The Washington Post

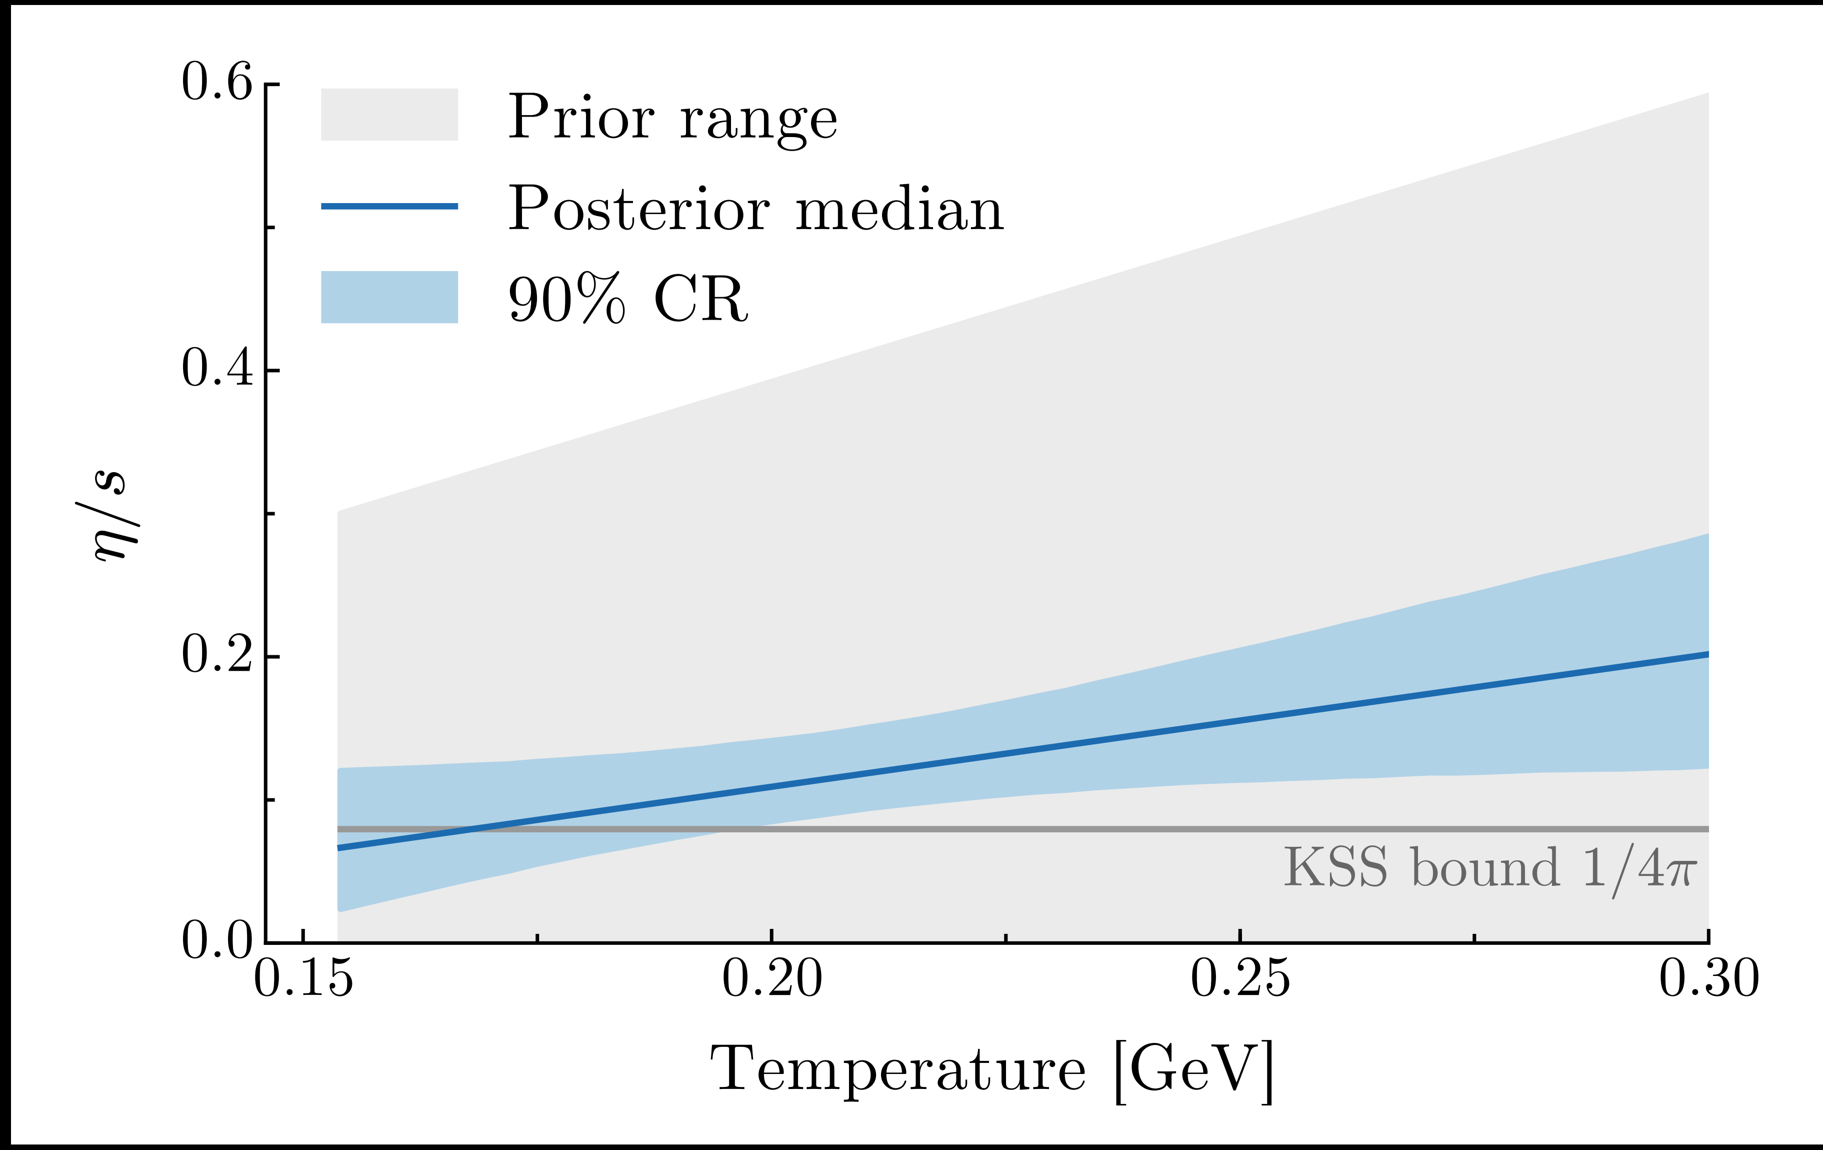
New results from a particle collider suggest that the universe behaved like a liquid in its earliest moments, not the fiery gas that was thought to have pervaded the first microseconds of existence.



Constraining the QCD EoS and the transport parameters







Analogy: Superconductivity

experimentally discovered 1911:

Heike Kamerlingh Onnes

macroscopic theory 1950:

Ginzburg-Landau

microscopic theory 1957:

Bardeen, Cooper and Schrieffer

Summary

- Making use of the spatial anisotropy we can study in detail the strong collective motion in the hot and dense system created in collisions of heavy-ions
  - allows us to test the QCD EoS and strongly constrain some of the key transport parameters
  - New insight in the properties of matter around the QCD phase transition
